

**RIPE NCC**

RIPE NETWORK COORDINATION CENTRE

# RPKI Operations for Ukraine

**Webinar**

**RIPE NCC Learning & Development**

**This session is  
being recorded**

# Overview

## BGP & Routing Security

- Is BGP Secure?

## What is RPKI?

- Resource Certification

## Route Origin Authorisation (ROA)

- What is a ROA?

## How to create a ROA?

- Registering routing info in the RPKI system

## RPKI Validation

- Deploying RPKI Validators
- Validating BGP Announcements
- Discarding BGP Invalids

## RPKI Statistics for Ukraine

- Review RPKI statistics in RIPEstat

## Demos

- Creating ROAs
- Running Validators
- Setting up BGP Origin Validation
- Discarding BGP Invalids

# **BGP & Routing Security**

Is BGP secure?

# BGP, Protocol of the Internet!

# How does it work?

10.10.10.0/23

20.20.20.0/23

# How does it work?

10.10.10.0/23

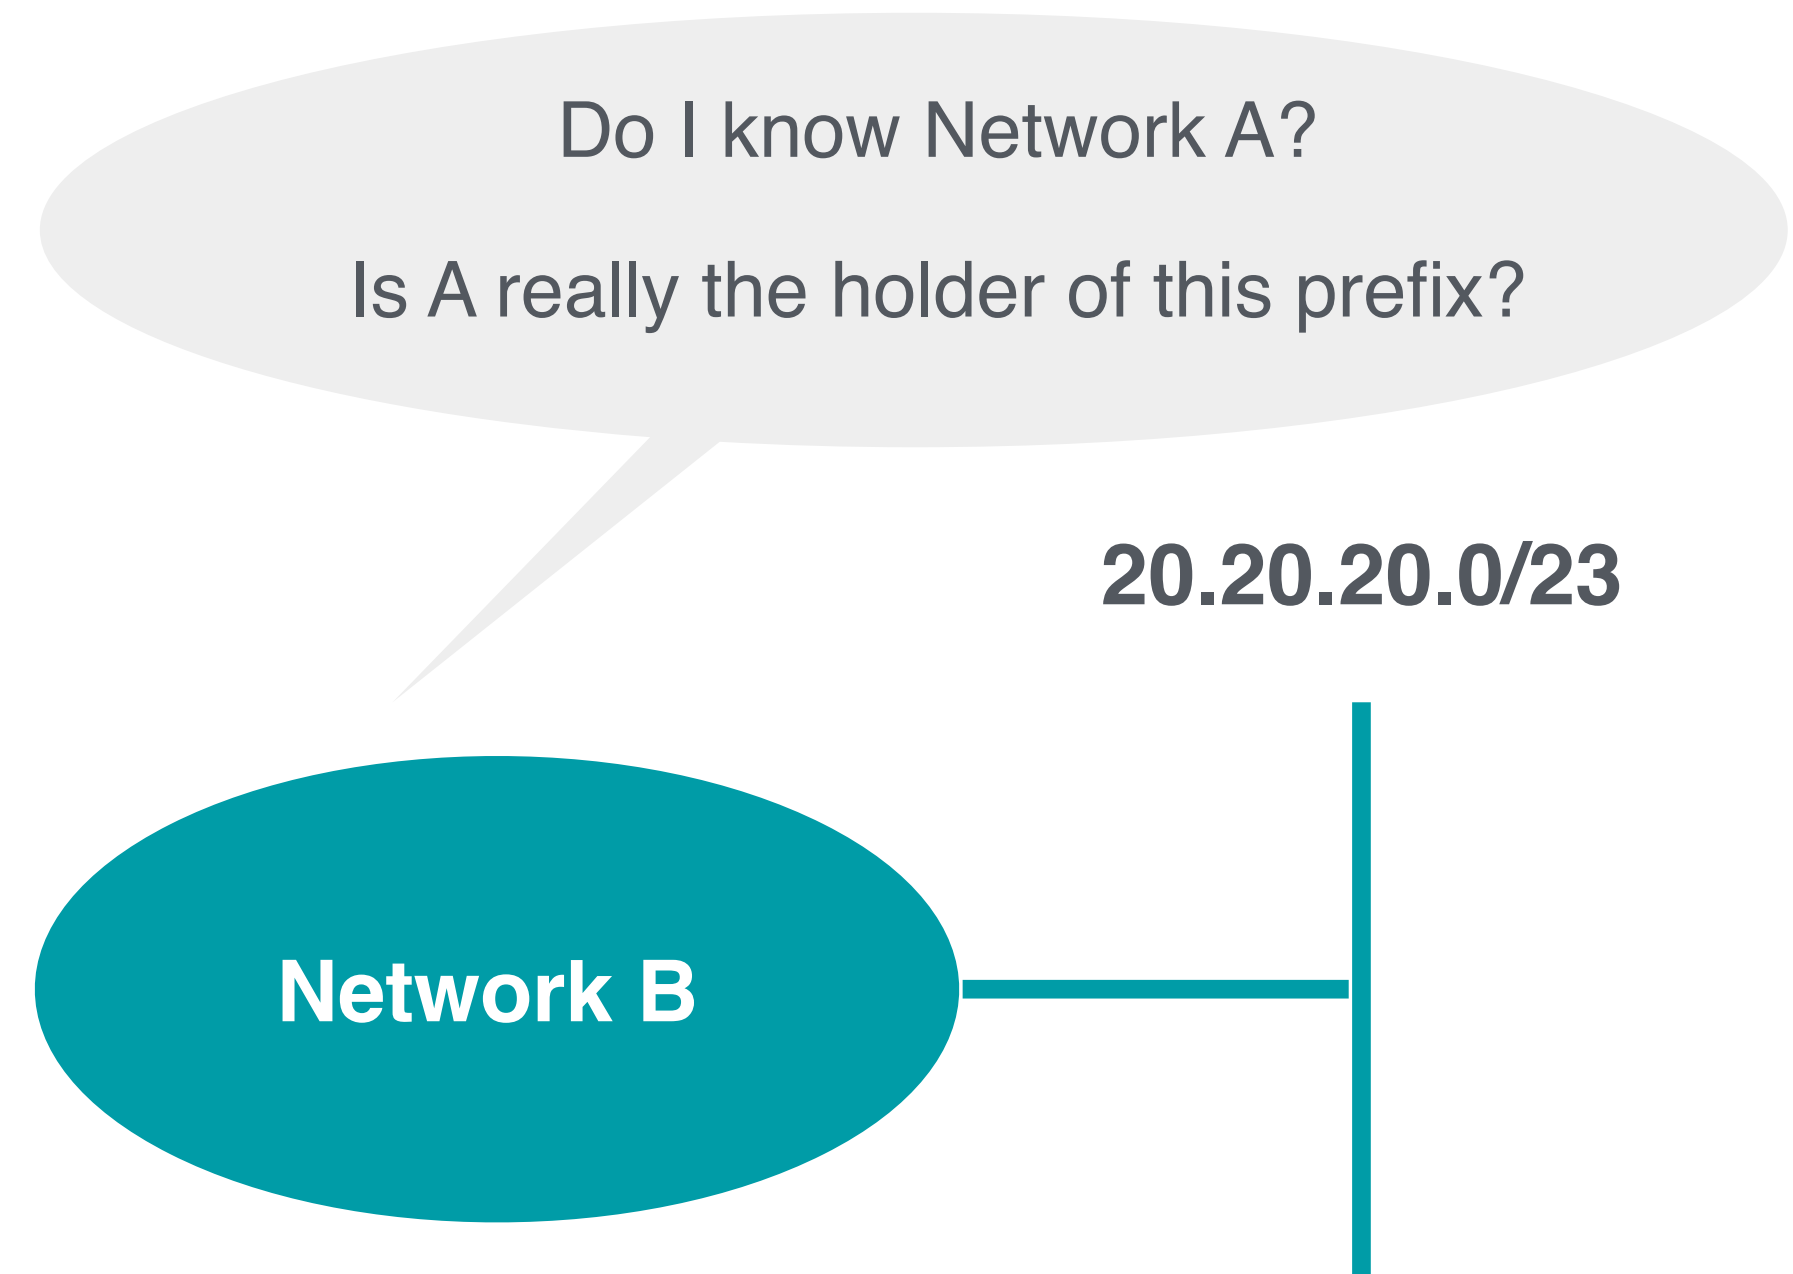

20.20.20.0/23

# How does it work?

10.10.10.0/23

20.20.20.0/23

# How does it work?

10.10.10.0/23

I don't know, but I'll trust it!

20.20.20.0/23

Routing table

10.10.10.0/23	A
---------------	---

# How does it work?

10.10.10.0/23

B: "I have 20.20.20.0/23"

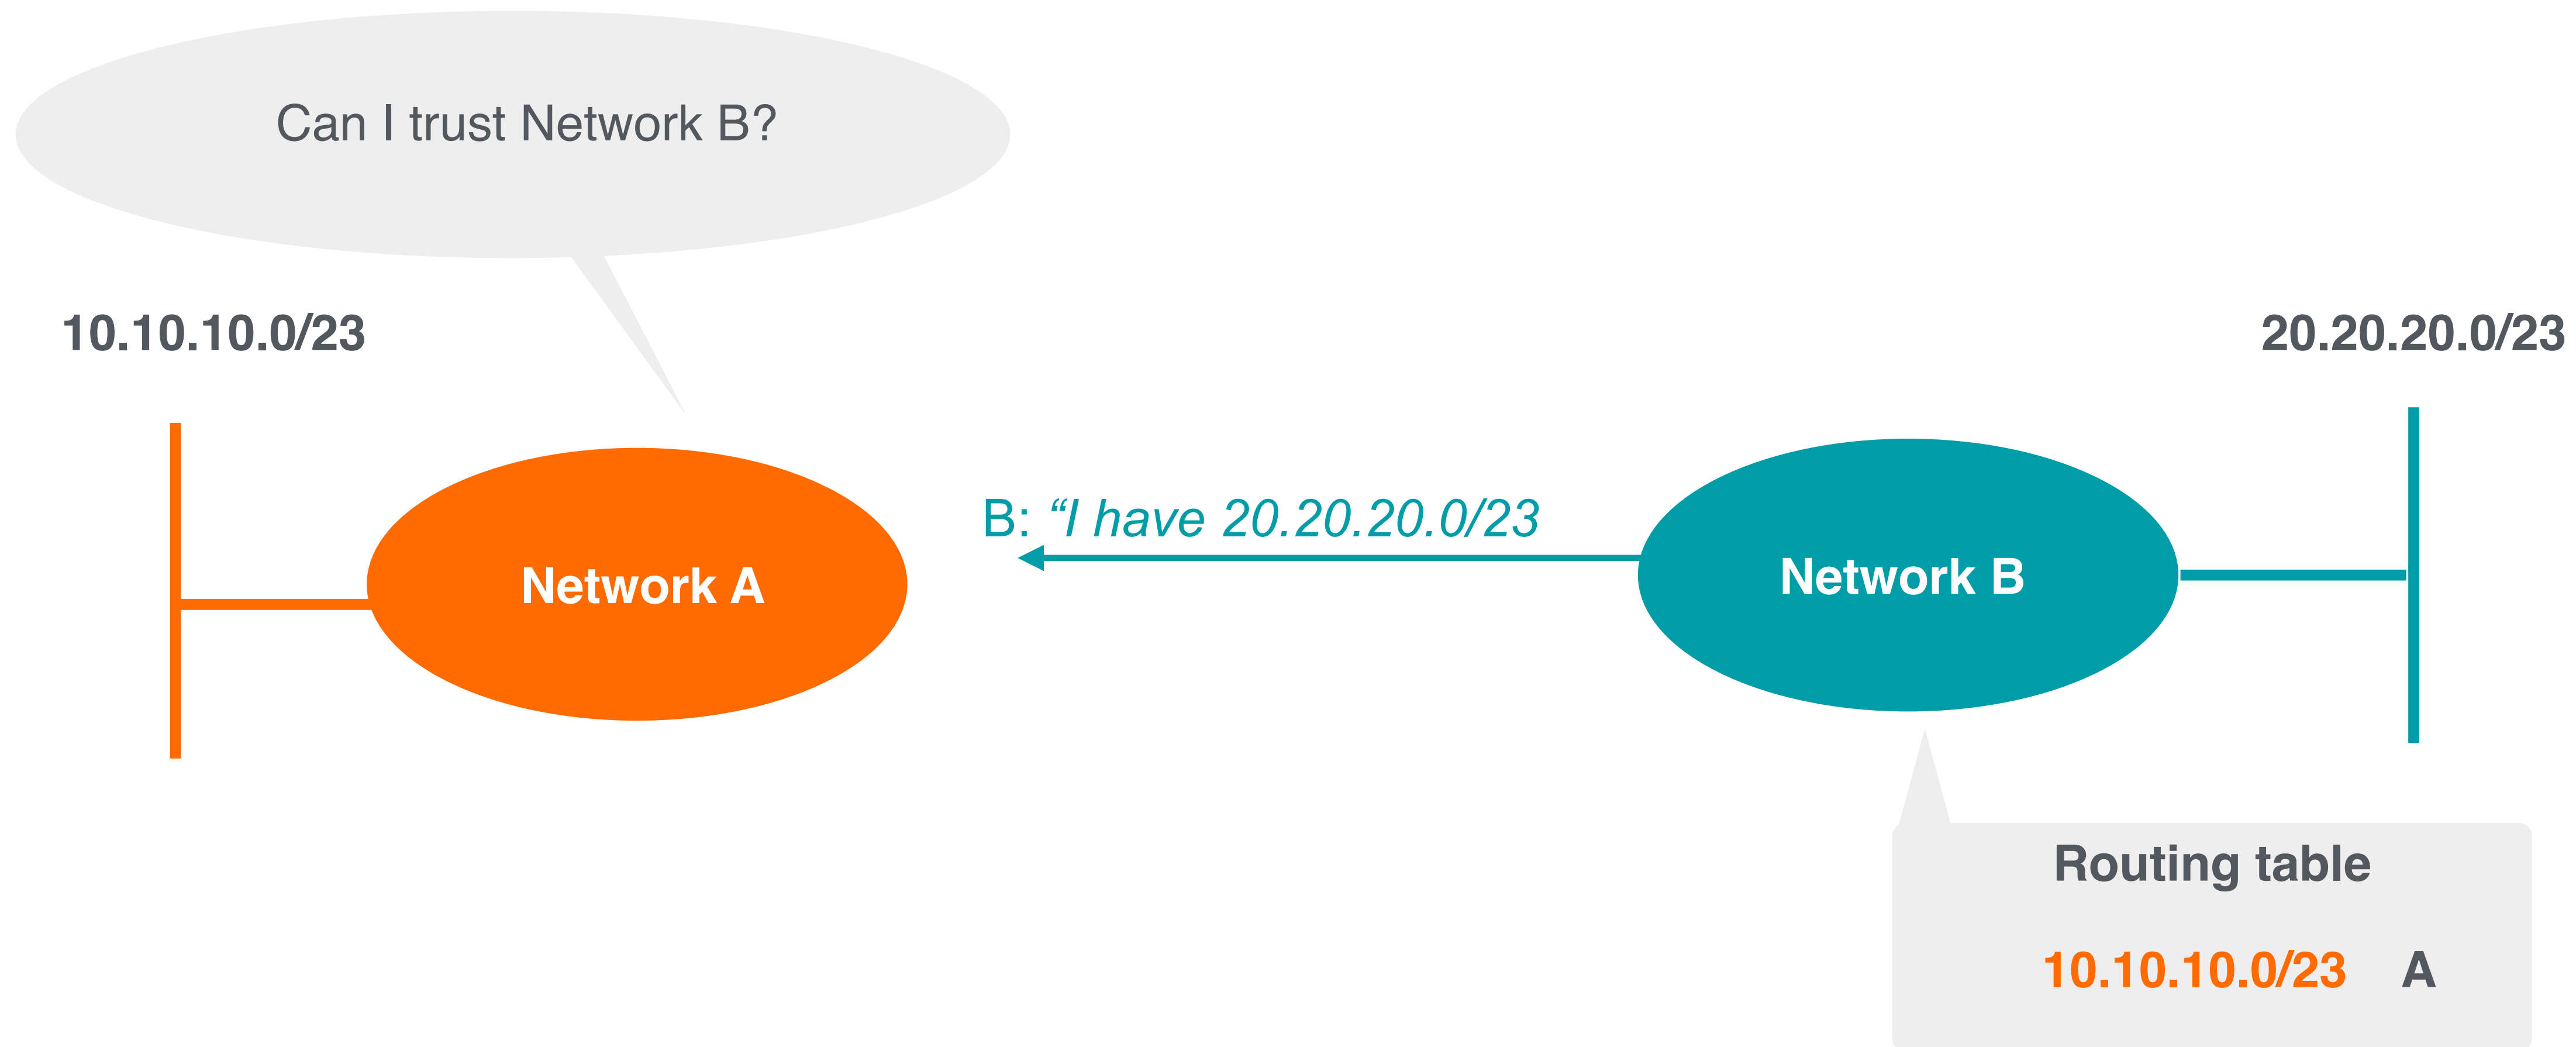

20.20.20.0/23

Routing table

10.10.10.0/23	A
---------------	---

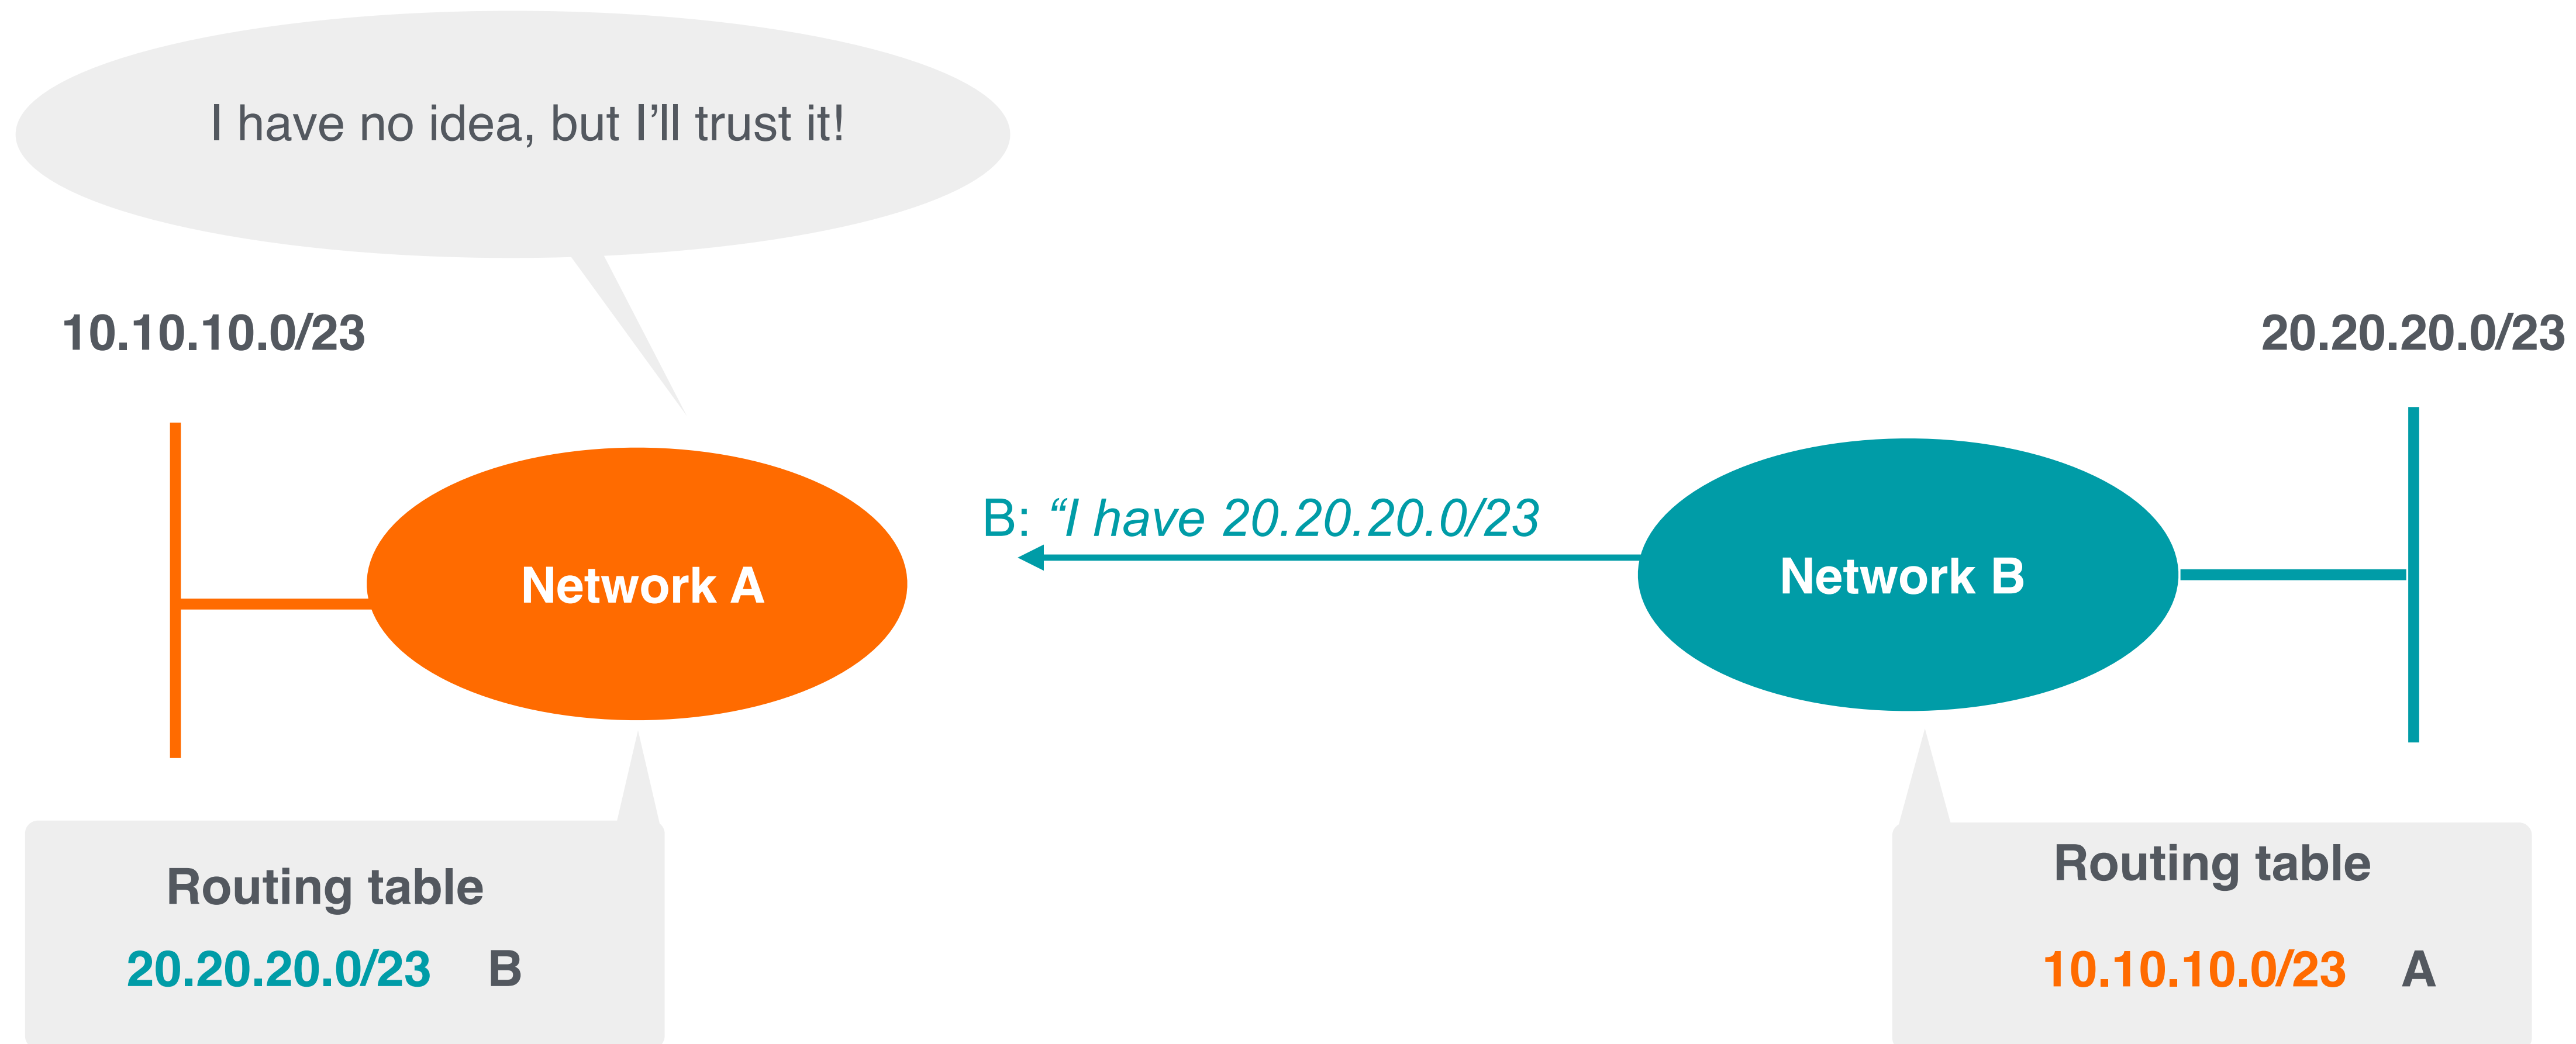

# How does it work?

# How does it work?

BGP is just based on **trust!**

# No built-in security in BGP!

- Any AS can announce any prefix
- Anyone can prepend any ASN to the BGP path
- BGP announcements are accepted without validation
- BGP packets are transmitted without any encryption or authentication mechanisms
- No single authoritative source for who should be doing what

# No built-in security in BGP!

- Any AS can announce any prefix
- Anyone can prepend any ASN to the BGP path
- BGP announcements are accepted without validation
- BGP packets are transmitted without any encryption or authentication mechanisms
- No single authoritative source for who should be doing what

**BGP is vulnerable to attacks!**

# Sometimes it happens accidentally!

- Typing errors
  - Also known as “fat fingers”
  - May cause mis-origination
- Configuration errors
  - Faulty BGP filter configuration
  - AS path prepending mistakes
  - Cause routing policy violations and unintentional route leaks

Accidental or intentional...  
Internet routing infrastructure is **affected!**

## In order to secure routing...

- We need to verify the routing information (Is it correct or not?)
  - Verify if the prefix is originated by the legitimate holder
- Prevent propagation of incorrect routing information

# But how?

1. **Check prefixes** before announcing

2. **Register** your routing information in **IRRs**

3. **Filter** BGP routes from your peers, customers and upstreams

4. Implement BGP filters based on **verifiable information**

IRRs are good, but not enough!

# Concerns with the IRR system

1

**Not globally deployed**

Just distributed databases

2

**No central authority**

Who will verify the accuracy of the data?

3

**No verification of  
holdership**

Anyone can input anything

4

**Not updated properly**

Information is missing,  
outdated or incorrect

# As a result...

IRRs are not so accurate

Data in IRRs is incomplete

They're not well-maintained

IRR filters are good **only if the IRR entries are correct!**

That's why the Internet community came up with the **RPKI** solution!

# **What is RPKI?**

Resource Certification

# What is RPKI?

- RPKI is...
  - A **resource certification** (X.509 PKI certificates)
  - A security framework
- It is used to make Internet routing more secure and reliable

# How does RPKI help with routing security?

- Verifies the association between resource holders and their Internet number resources.
  - Proves holdship through a public key and certificate infrastructure
- Used to validate the **origin of BGP announcements**
  - Is the originating ASN authorised to originate a particular prefix?
- Stepping stone to “**Path Validation**”

# How does it work?

Ties IP addresses and ASNs to public keys

Follows the RIR hierarchy

Authorised statements from resource holders

- “ASN X is authorised to announce my prefix Y”
- Signed, holder of Y

# RIPE NCC Root Certificate

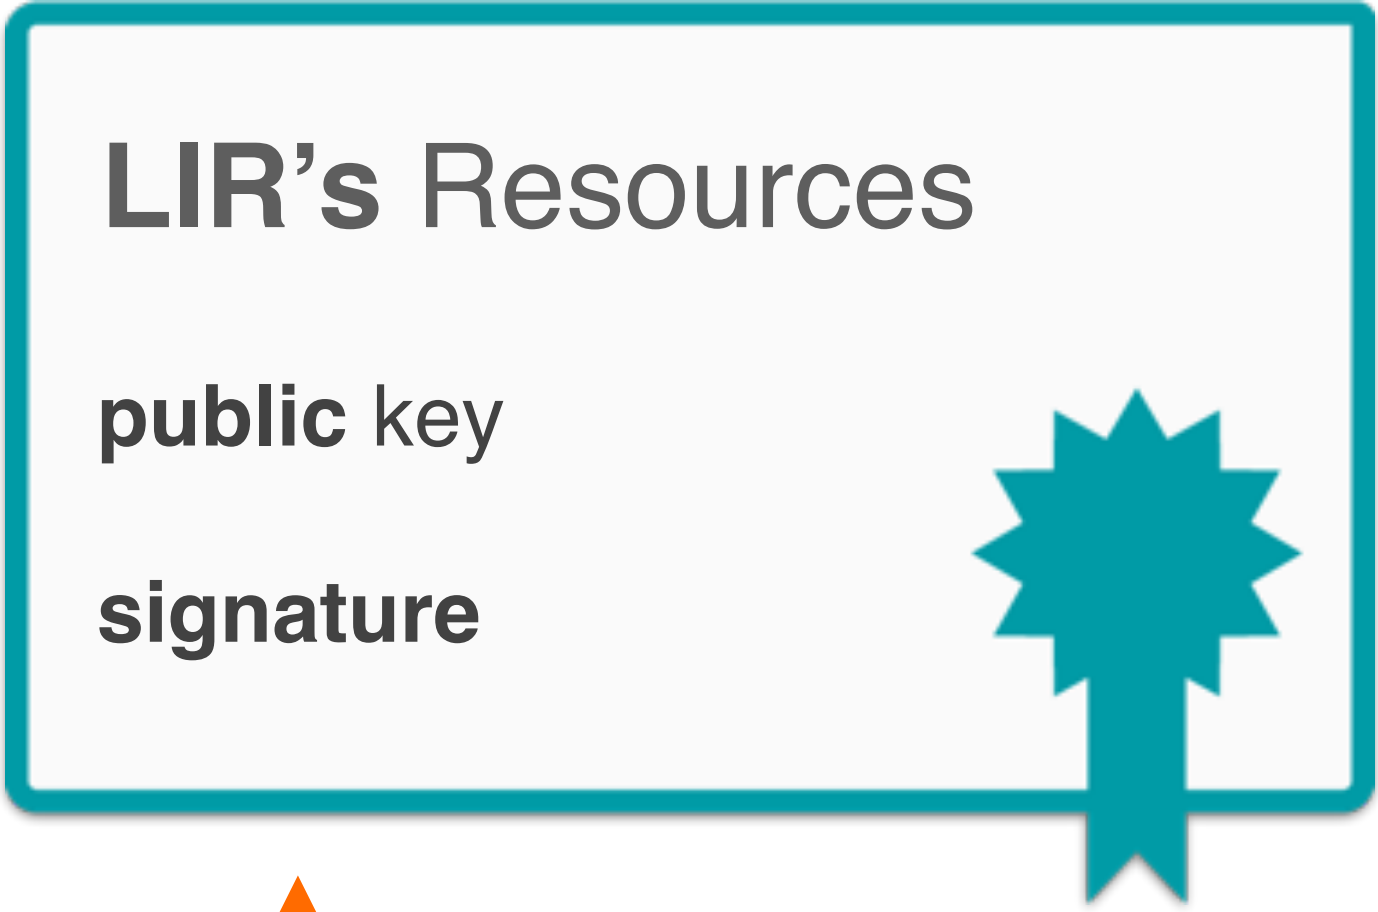

Self-signed

Root's private key

# LIR Certificate

Signed by the root's private key

Root's **private** key

# Authorised Statement

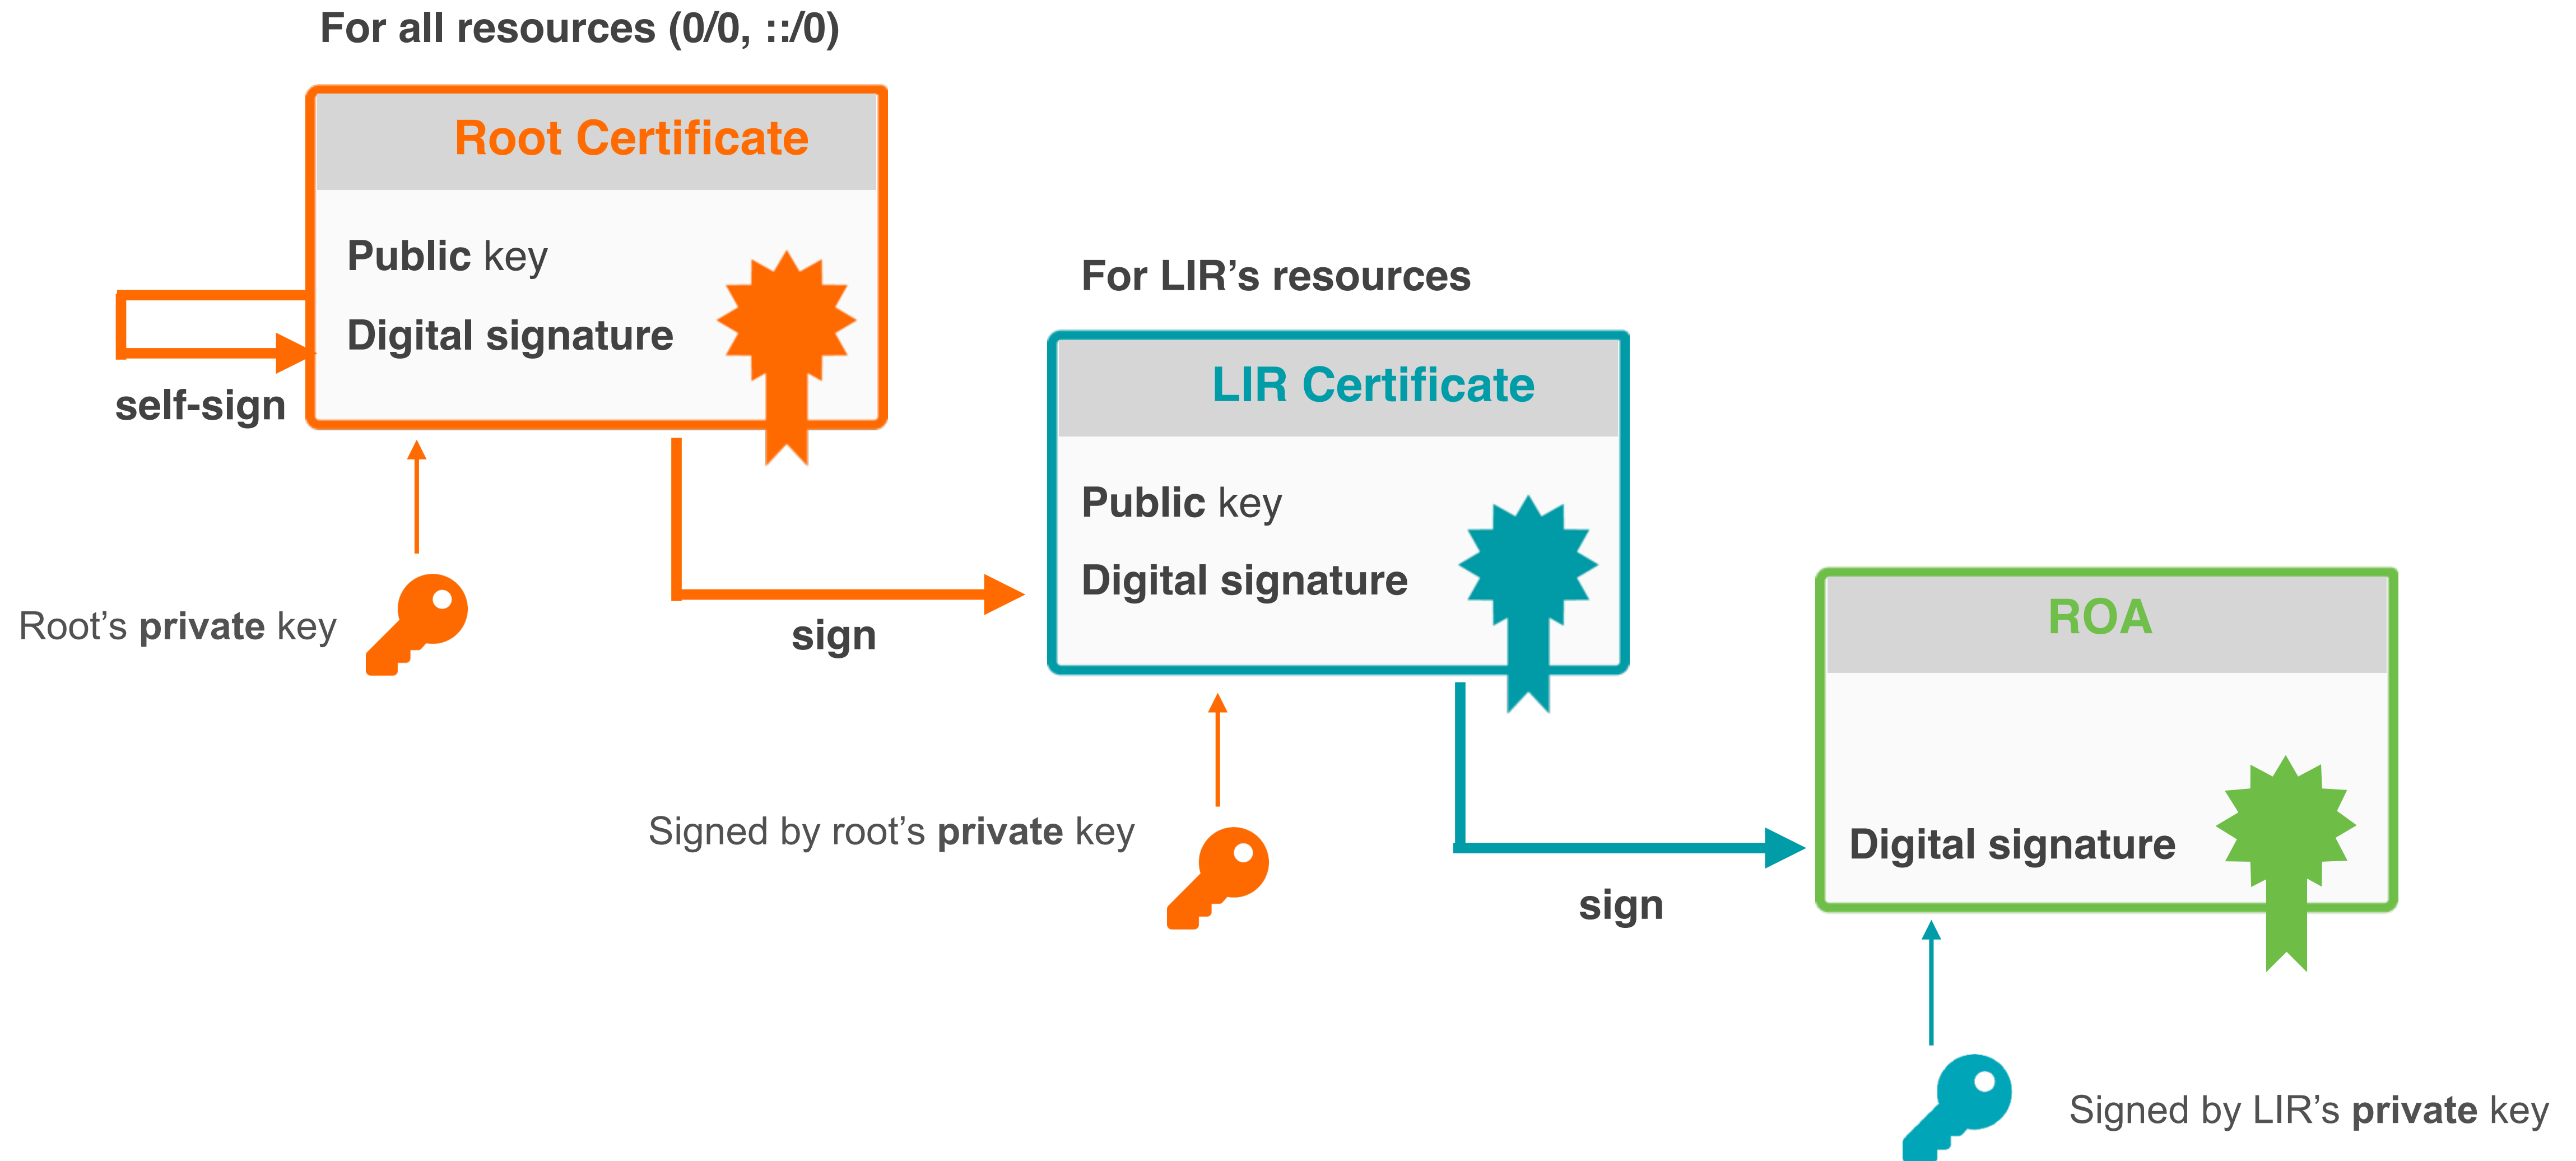

Signed by LIR's private key

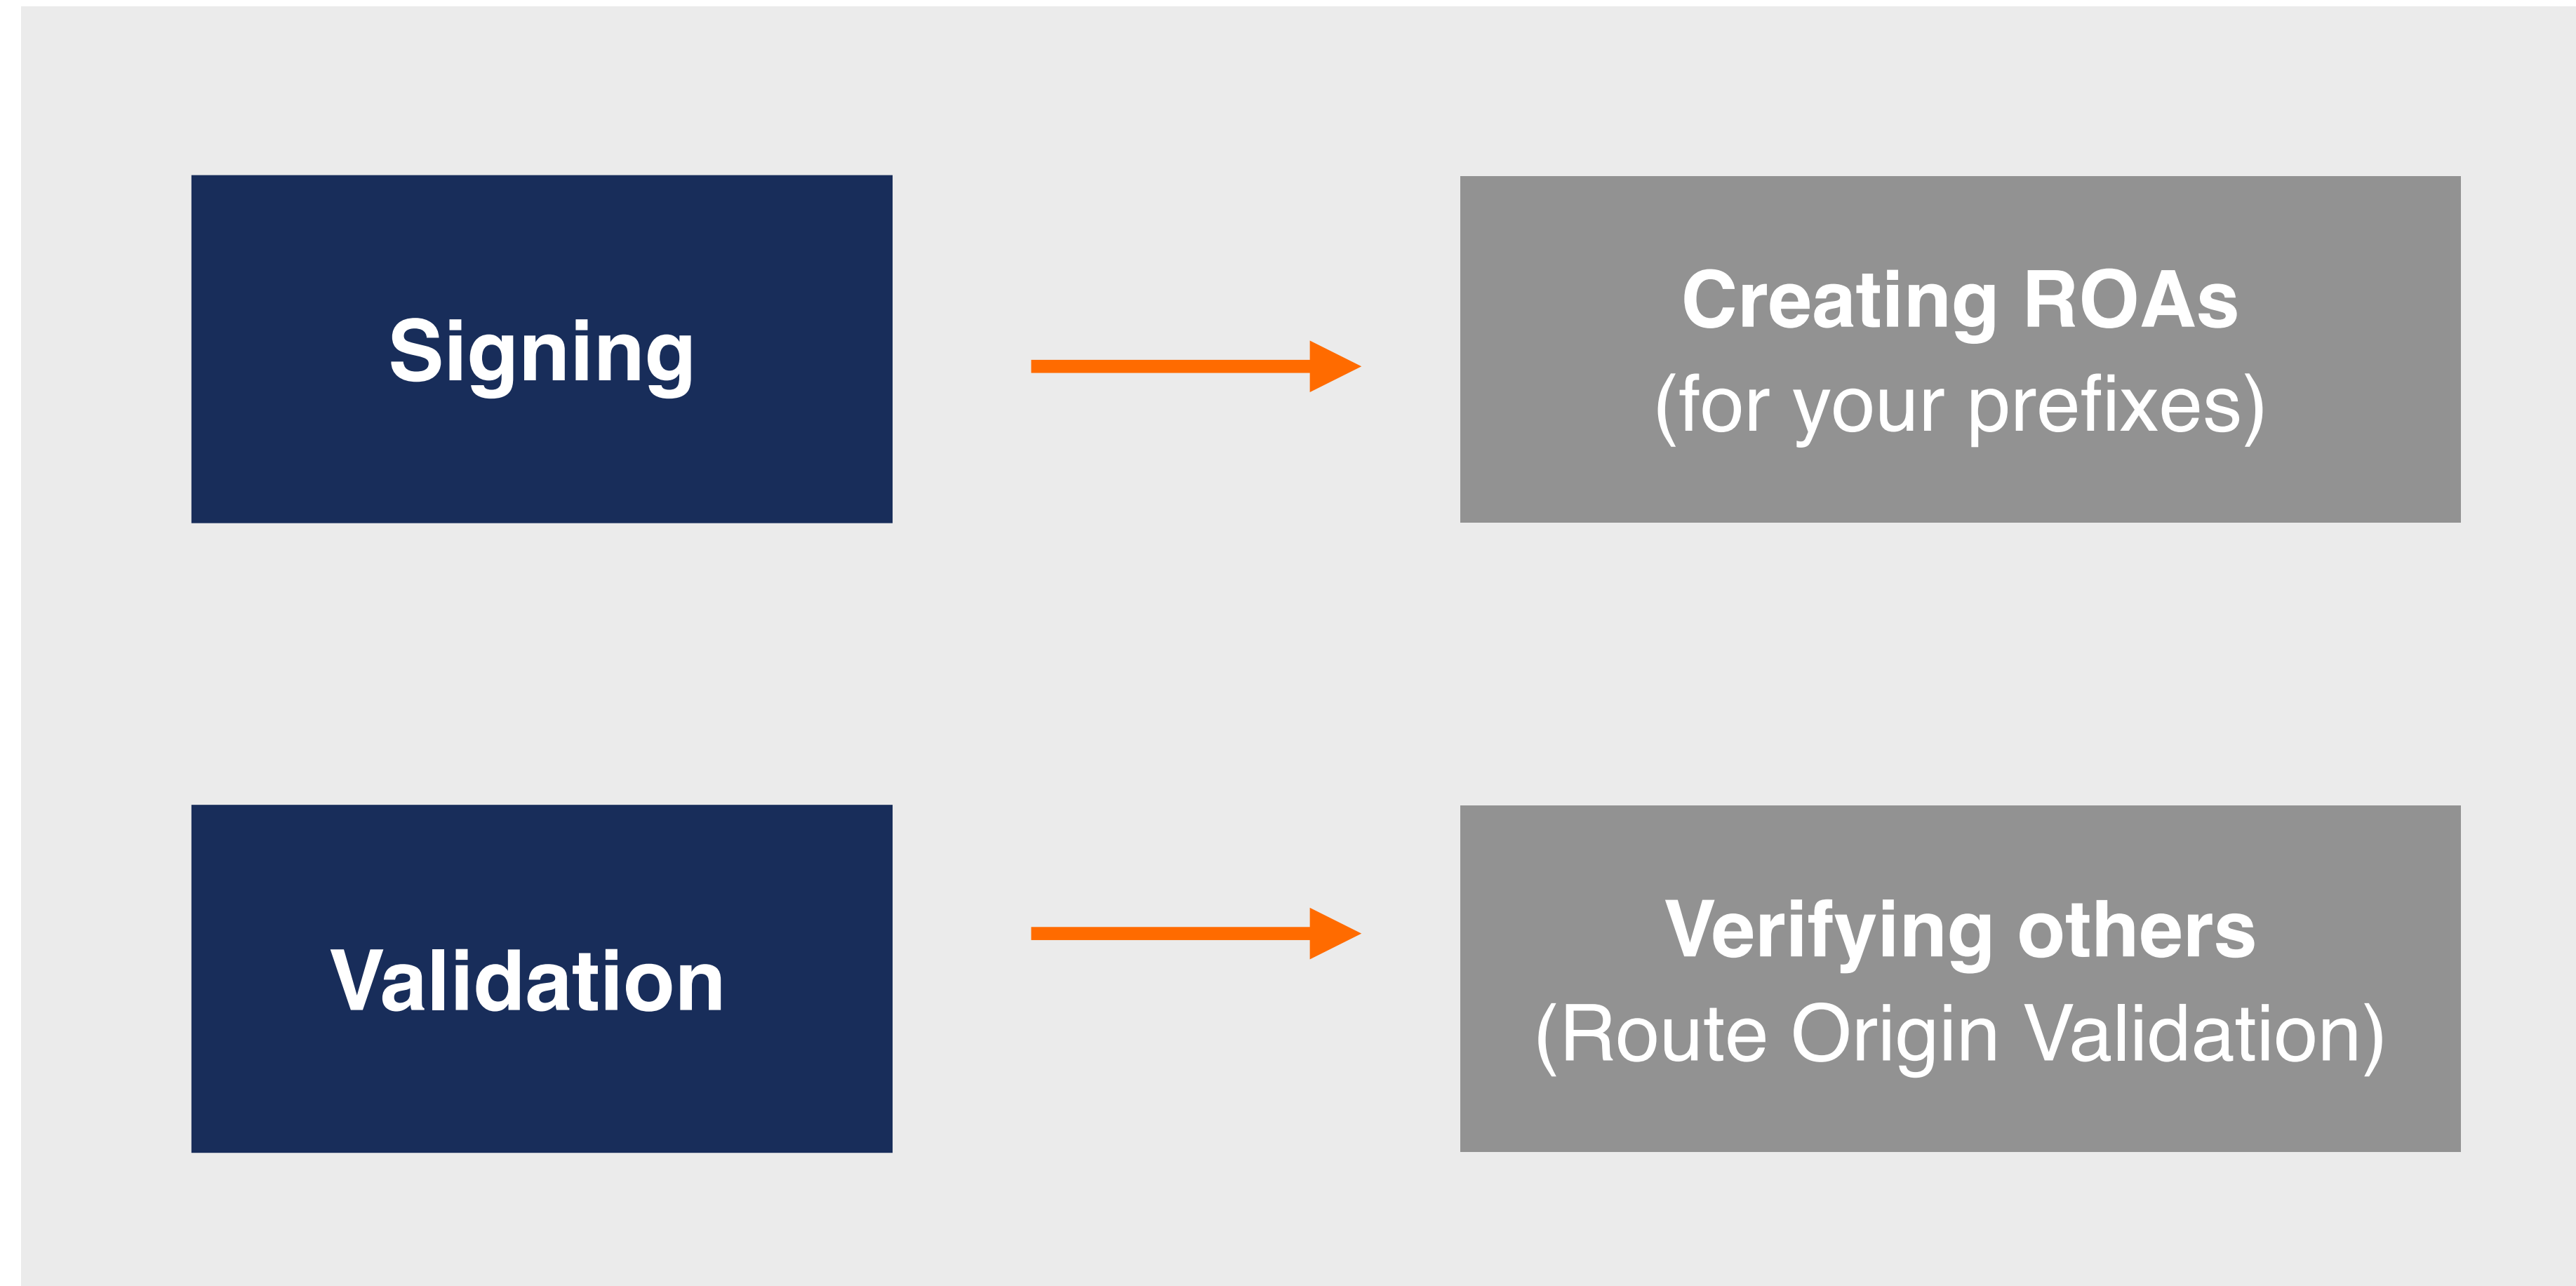

LIR's private key

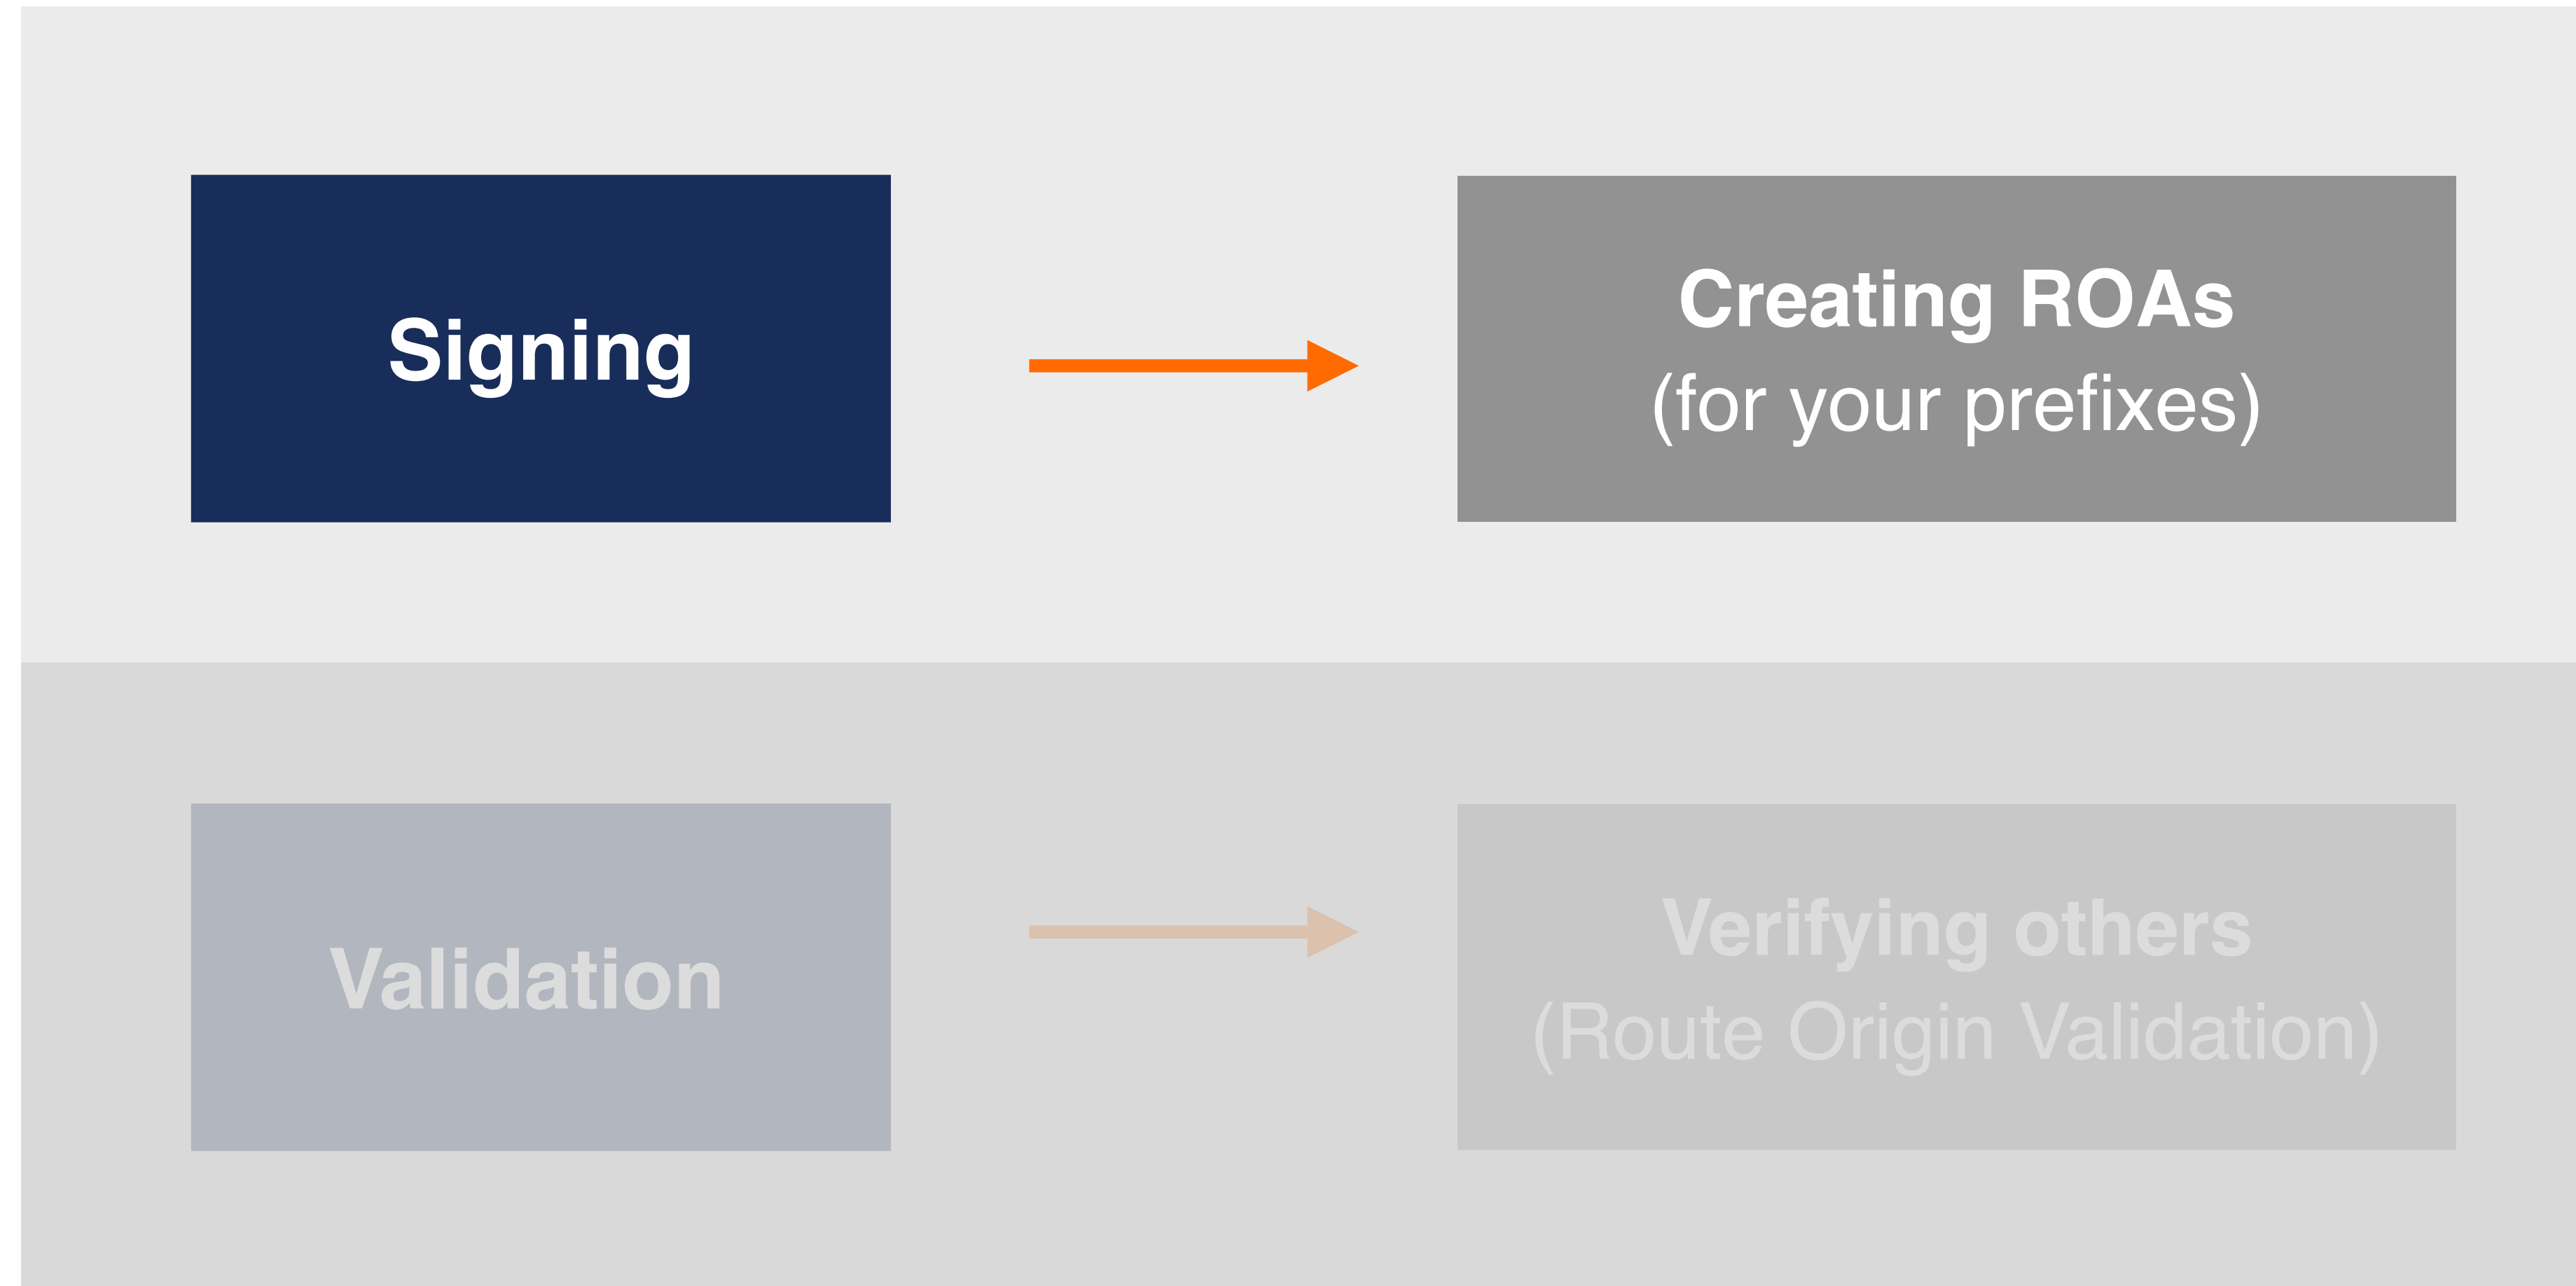

# RPKI Chain of Trust

# RPKI has two elements

# RPKI has two elements

**ROA**

Route Origin Authorisation

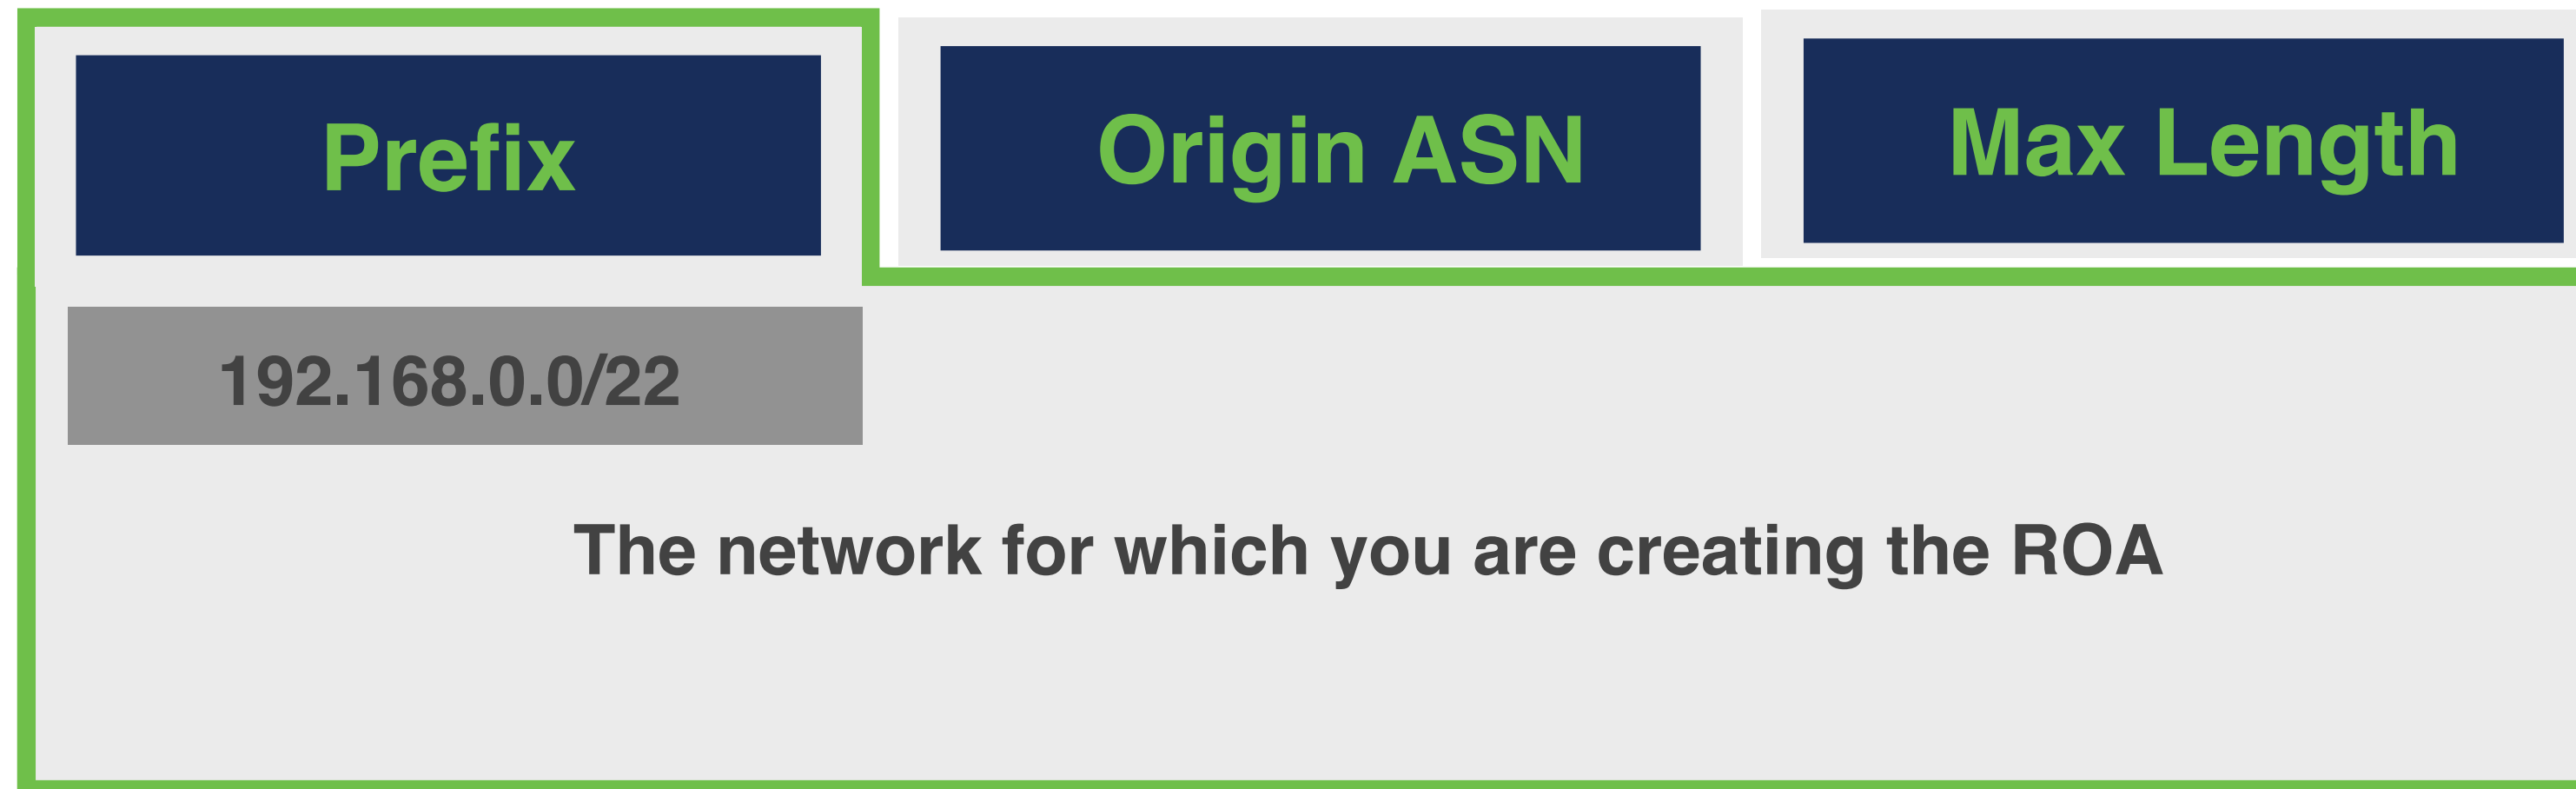

# ROA (Route Origin Authorisation)

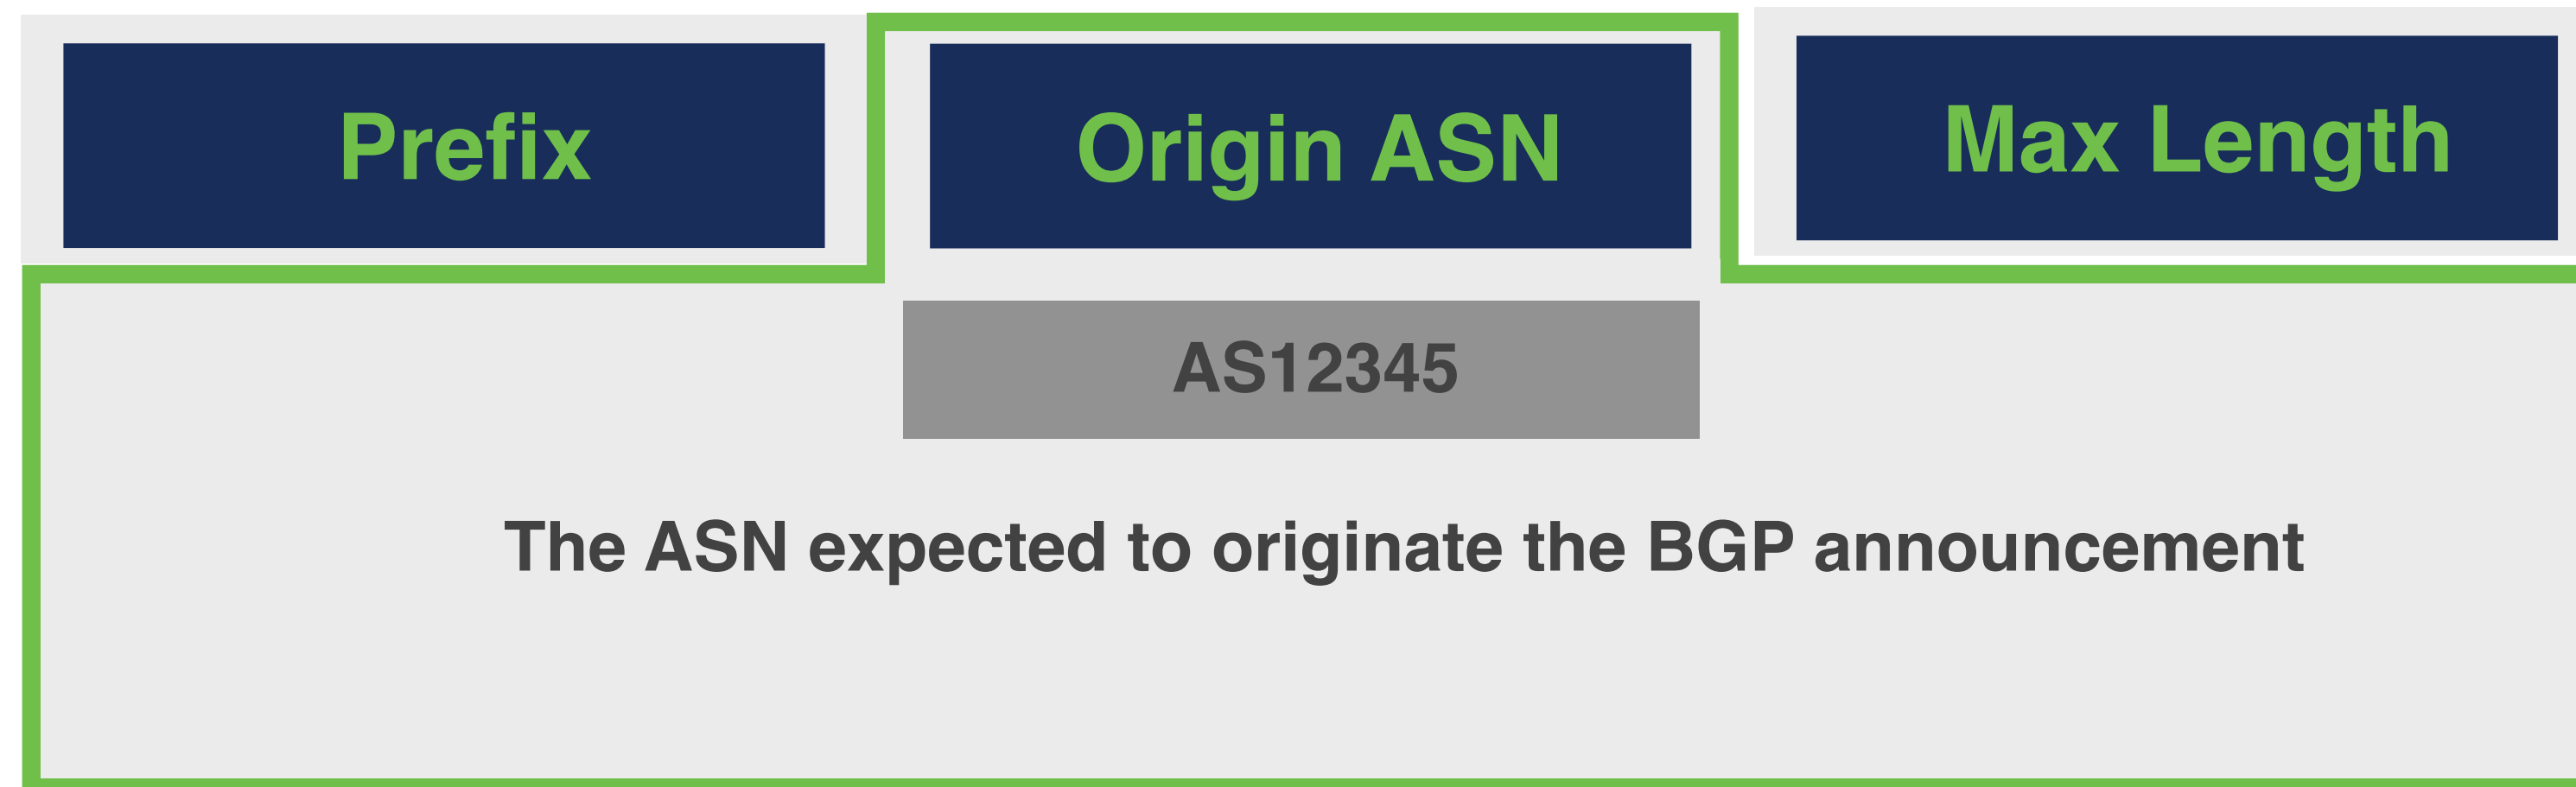

- An **authorised statement** created by the resource holder
- Contains a list of address prefixes and an AS Number
- LIRs can create a ROA for their resources
- Multiple ROAs can exist for the same prefix
- ROAs can overlap

ROA	
Prefix	192.168.0.0/22
Max Length	/22
Origin AS	AS12345

# What is in a ROA?

# What is in a ROA?

# **How to create a ROA?**

Registering routing info in the RPKI system

# RPKI Certificate Structure

- RPKI relies on RIRs
- 5 RIRs run a root CA with a Trust Anchor
- RIRs can verify who is creating objects in the RPKI system

# How to create a ROA?

- 1 Login to LIR Portal (my.ripe.net)
- 2 Go to the RPKI Dashboard
- 3 Choose which RPKI model to us

Hosted

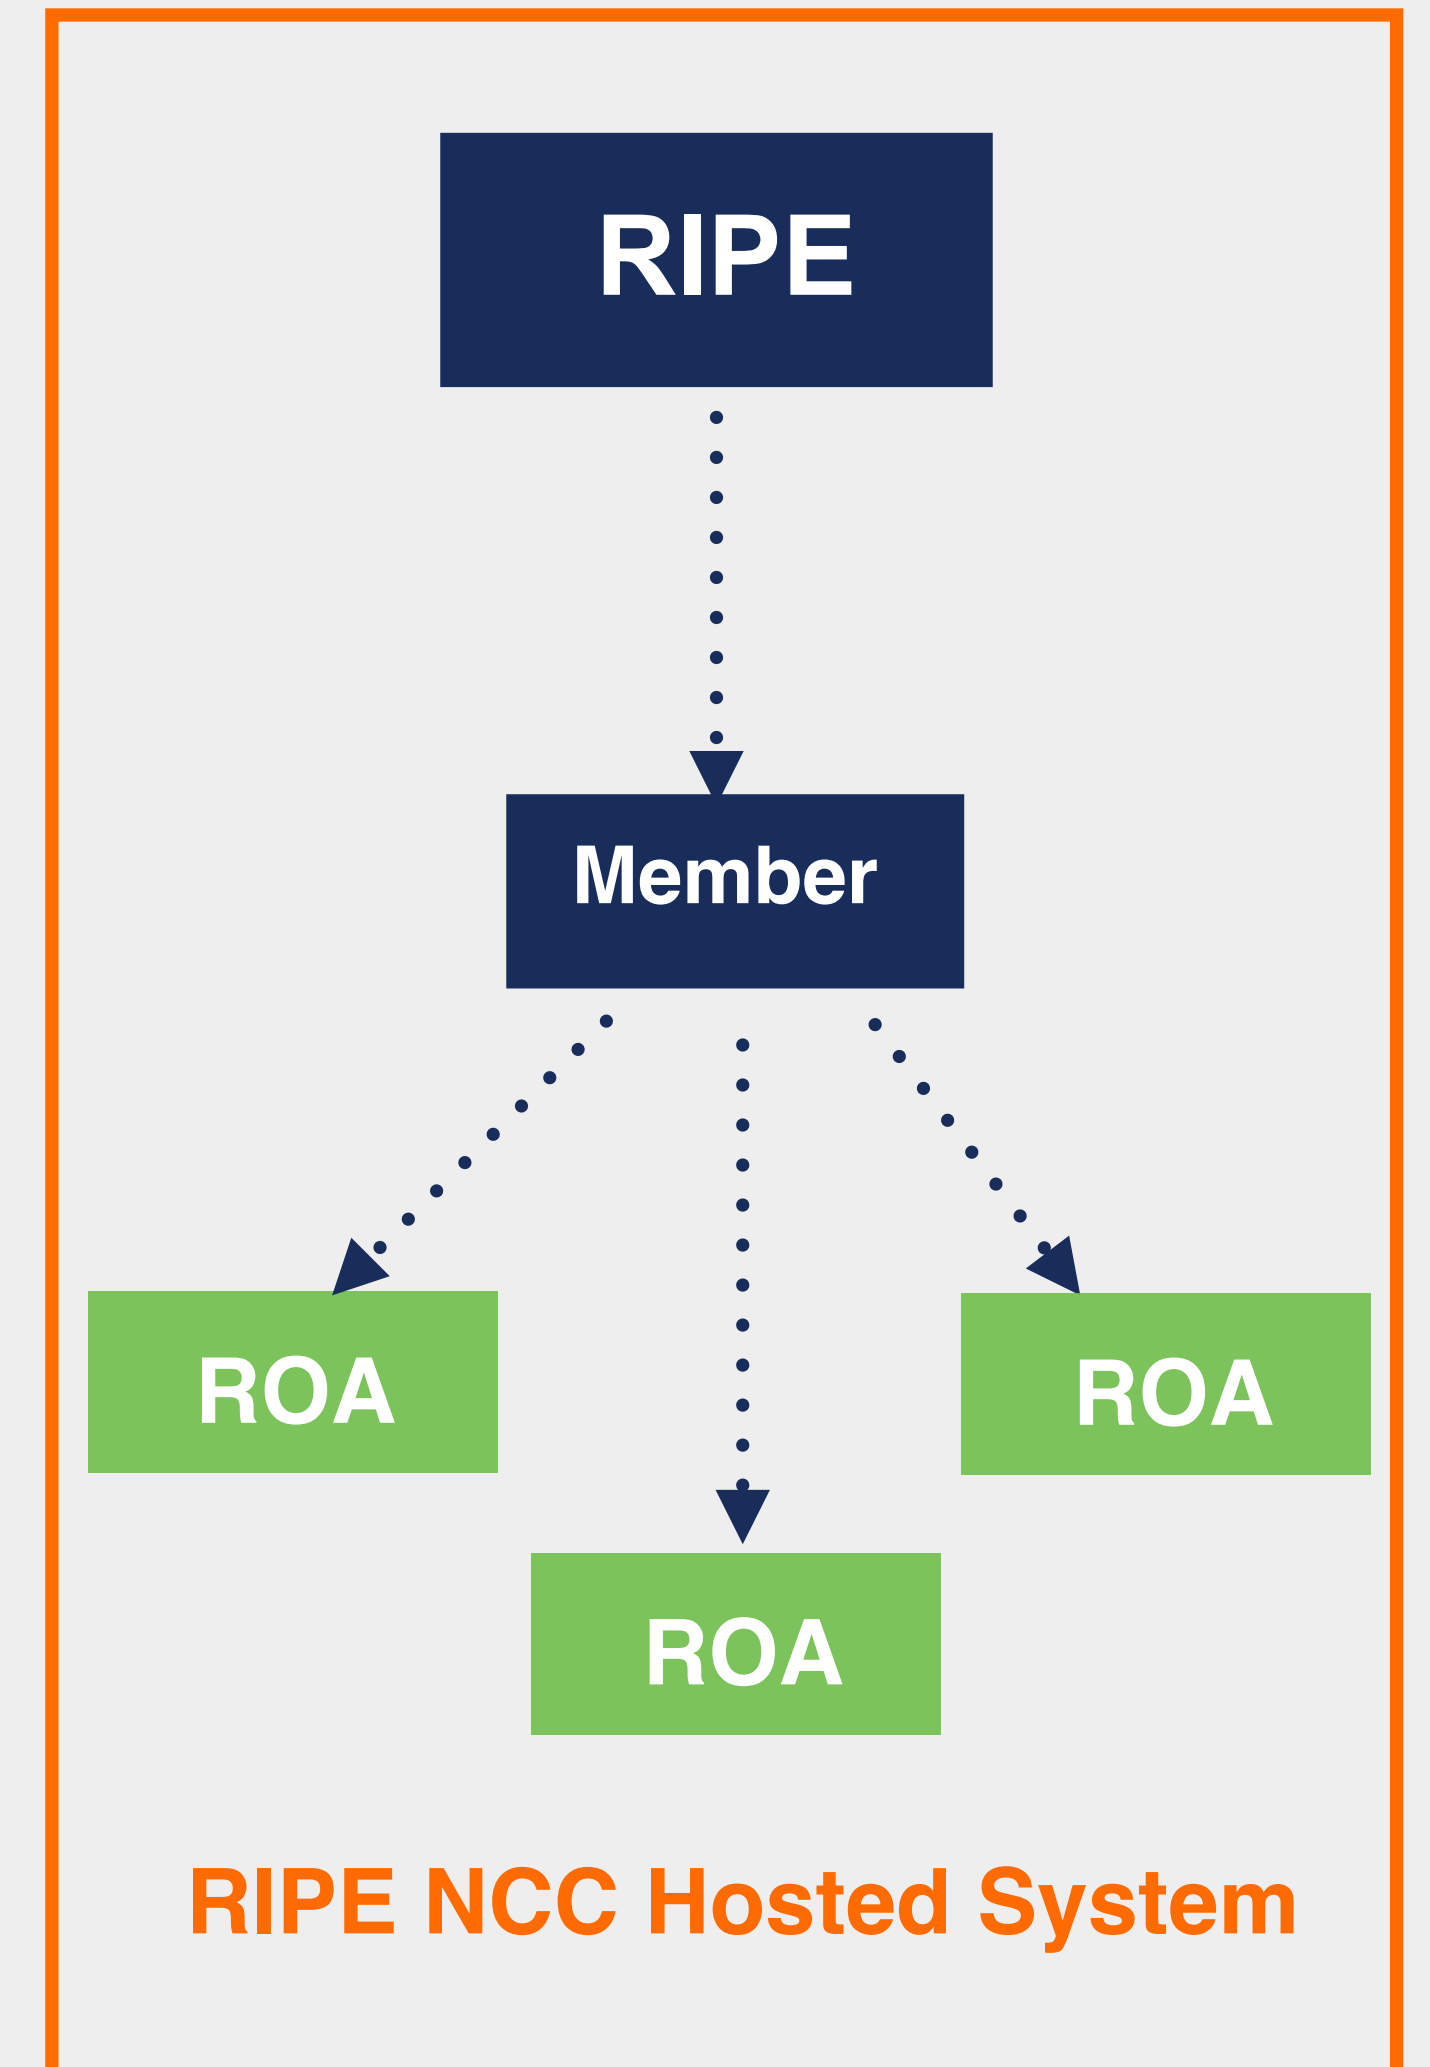

Delegated

The screenshot shows the LIR Portal interface. On the left is a dark sidebar with a menu. The 'RPKI' option, labeled 'RPKI Dashboard', is highlighted with an orange box and has an arrow pointing to the right. The main content area shows a form titled 'Create a Certificate Authority for bh.viacloud'. The form includes the 'RIPE NCC Certification Service Terms and Conditions' and an 'Introduction' section. Under the heading 'Type of Certificate Authority', there is explanatory text for both 'Hosted' and 'Delegated' models. At the bottom of the form, two radio button options are visible: 'Hosted' and 'Delegated', both of which are enclosed in orange boxes. An orange arrow points from the 'Hosted' option in the form to the 'Hosted' text box above it, and another orange arrow points from the 'Delegated' option in the form to the 'Delegated' text box above it.

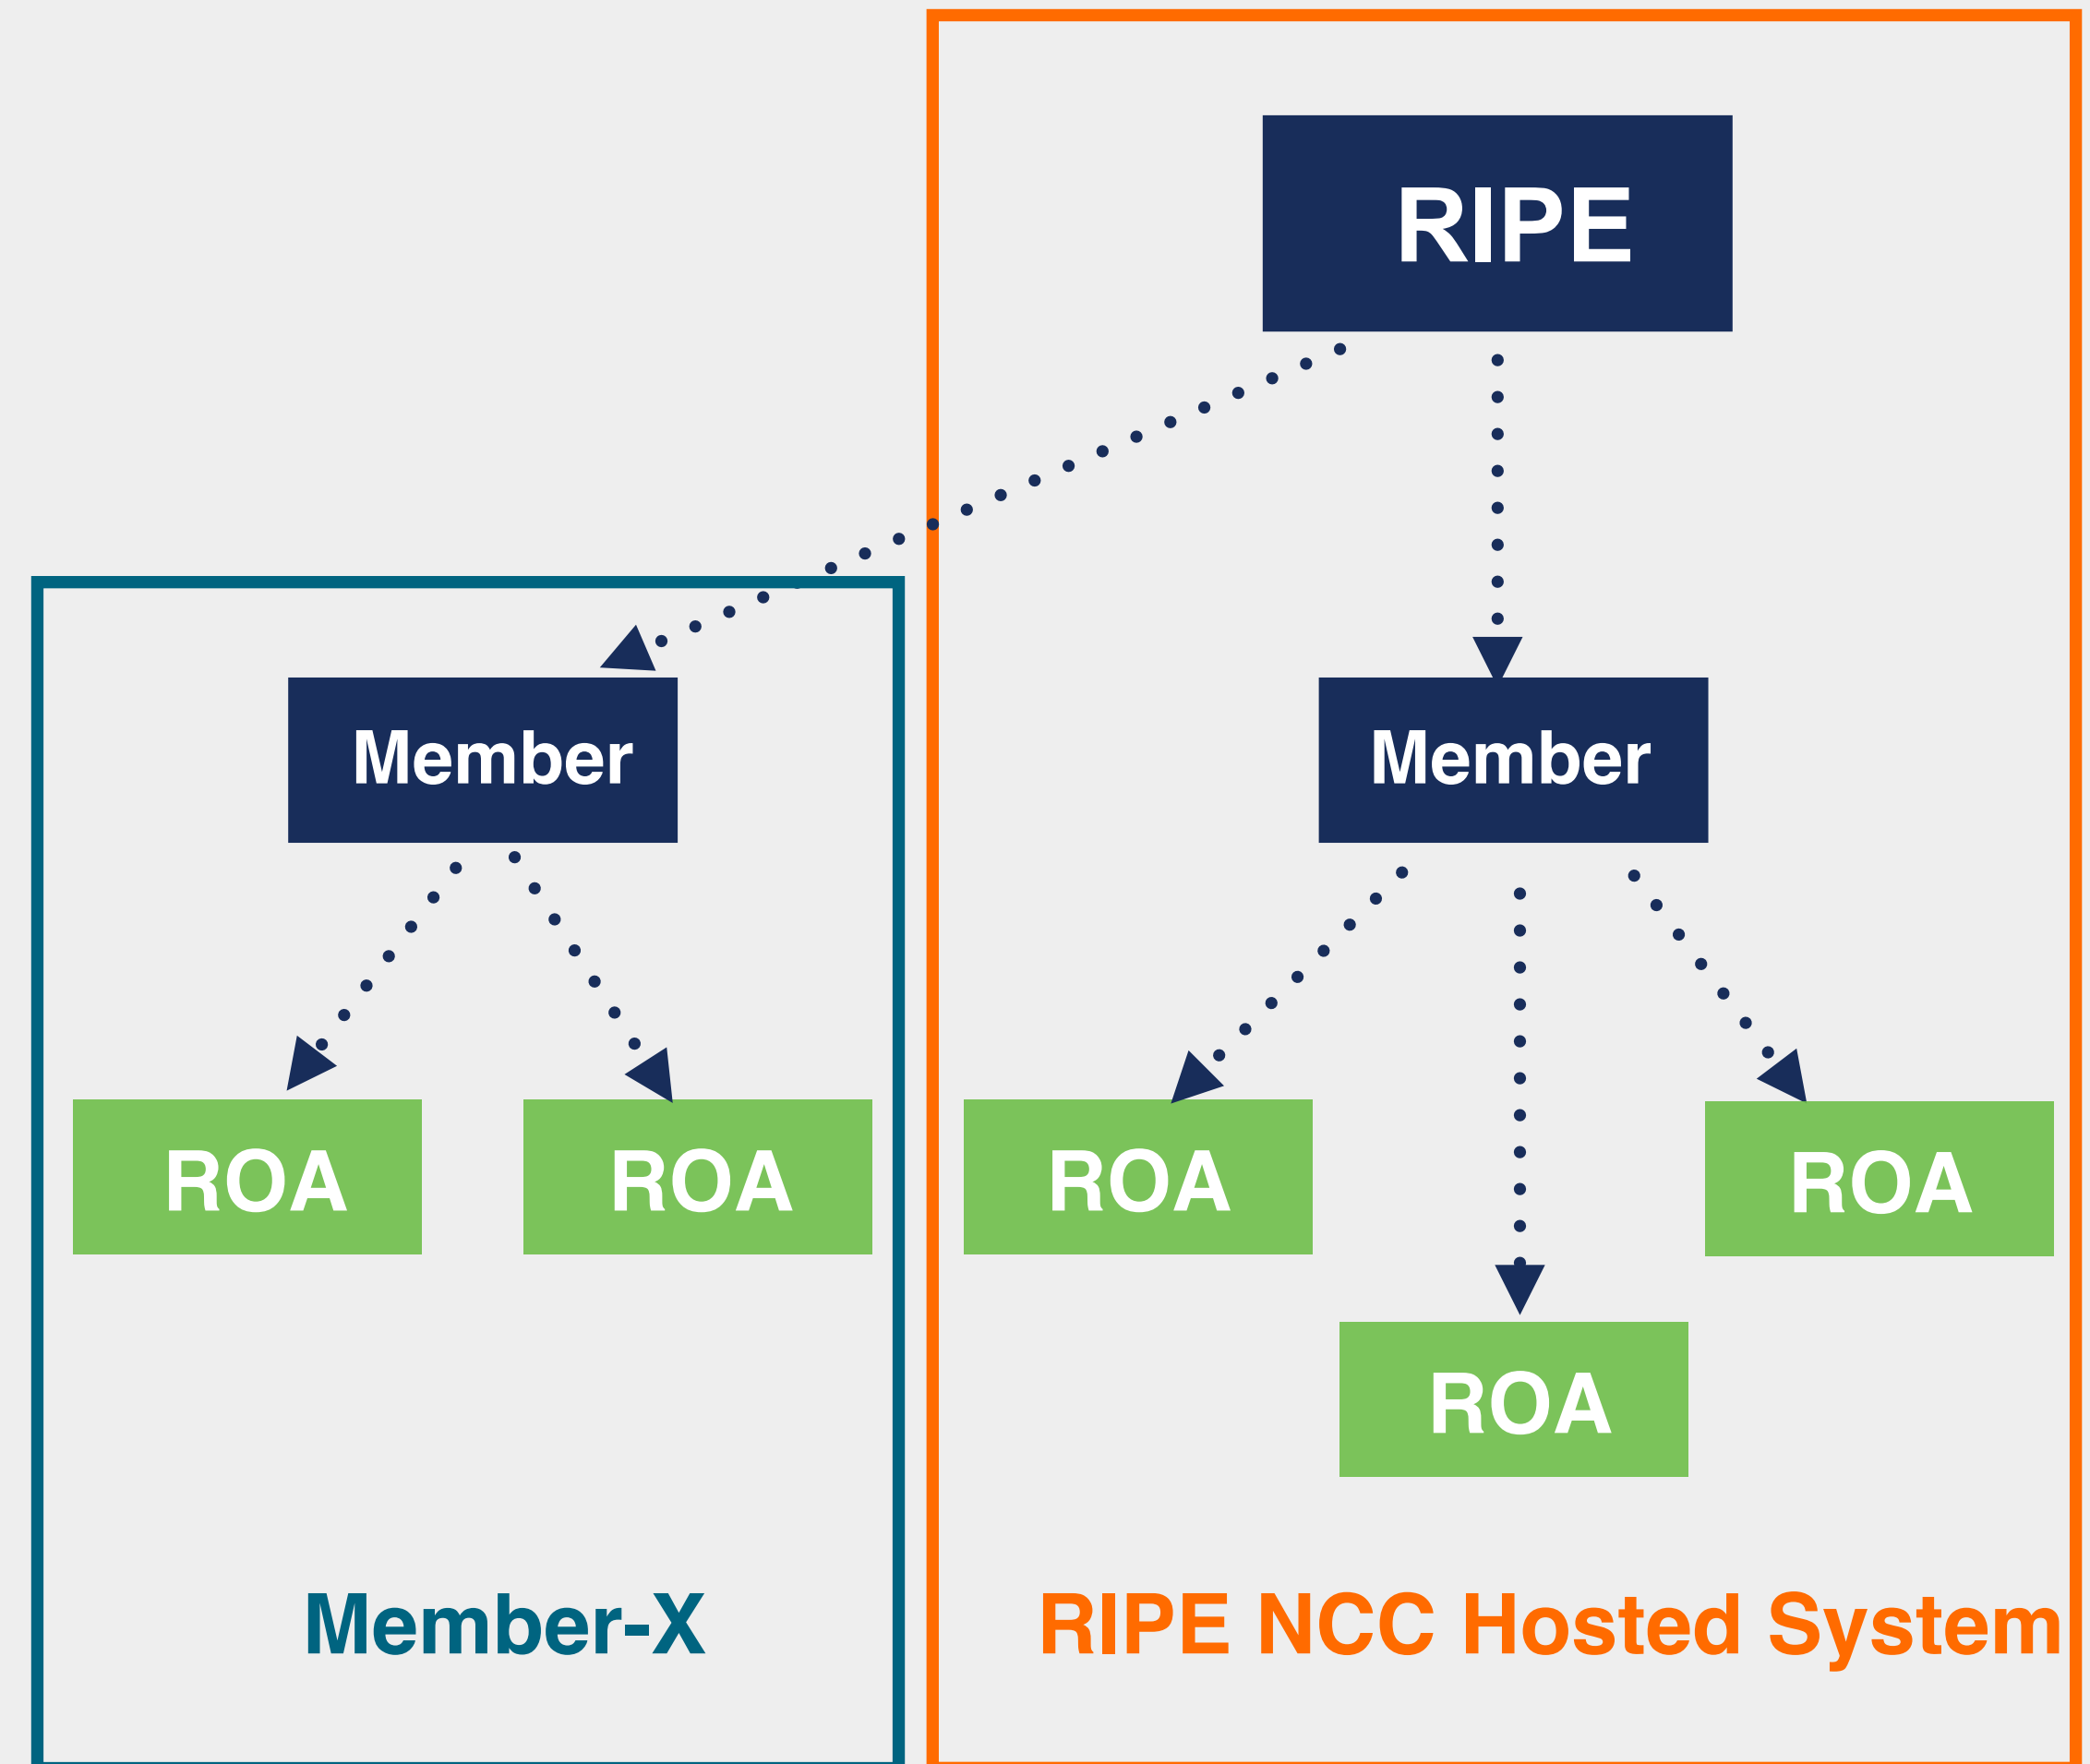

# Hosted RPKI

- ROAs are created and published using the **RIR member portal**
- RIR hosts a CA and signs all ROAs
- Automated signing and key rollovers
- Allows you to focus on creating and publishing ROAs

# Delegated RPKI

- Run your own Certificate Authority software
  - Dragon Research Labs, RPKI Toolkit
  - NLnet Labs, Krill
- Create ROAs in your own platform
- Manage your own keys/key rollovers
- Set up connection with RIPE NCC CA
- Generate LIR certificate and get it signed by parent CA

# RIPE NCC RPKI Dashboard

● Create a Certificate Authority for bh.viacloud

## RIPE NCC Certification Service Terms and Conditions

### Introduction

This document will stipulate the Terms and Conditions for the RIPE NCC Certification Service. The RIPE NCC Certification Service is based on Internet Engineering Task Force (IETF) standards, in particular RFC3647, "Internet X.509 Public Key Infrastructure Certificate Policy and Certification Practices Framework", RFC3779, "X.509 Extensions for IP Addresses and AS Identifiers", and the "Certificate Policy (CP) for the Resource PKI (RPKI)".

### Article 1 - Definitions

#### Type of Certificate Authority

You can choose between asking the RIPE NCC to host your RPKI Certificate Authority (Hosted RPKI) or running your own Certificate Authority (Delegated RPKI).

Select "Hosted" if you would like the RIPE NCC to host your Certificate Authority keys, ROAs, manifests etc. and publish the information in our repository. You will only need to maintain your ROAs in our dashboard. This is the recommended option if you are not an RPKI expert.

Select "Delegated" to run your own Certificate Authority and to host your own keys, ROAs, manifests etc. you will need to run additional software to proceed.

Hosted  
 Delegated

# **RPKI Validation**

Deploying RPKI Validators

# RPKI has two elements

# RPKI Validation

- Verifying the information provided by others
- Goal is to validate the “origin of BGP announcements”
- Known as:
  - BGP Origin Validation (BGP OV) or
  - Route Origin Validation (ROV)

# In order to validate BGP announcements...

- You need to:
  - Install a **validator software** locally in your network
  - Download all ROAs from RIR repositories
  - Validate ROAs by using a validator
  - Compare valid ROAs with BGP announcements
- Then you can make decisions based on the validation results

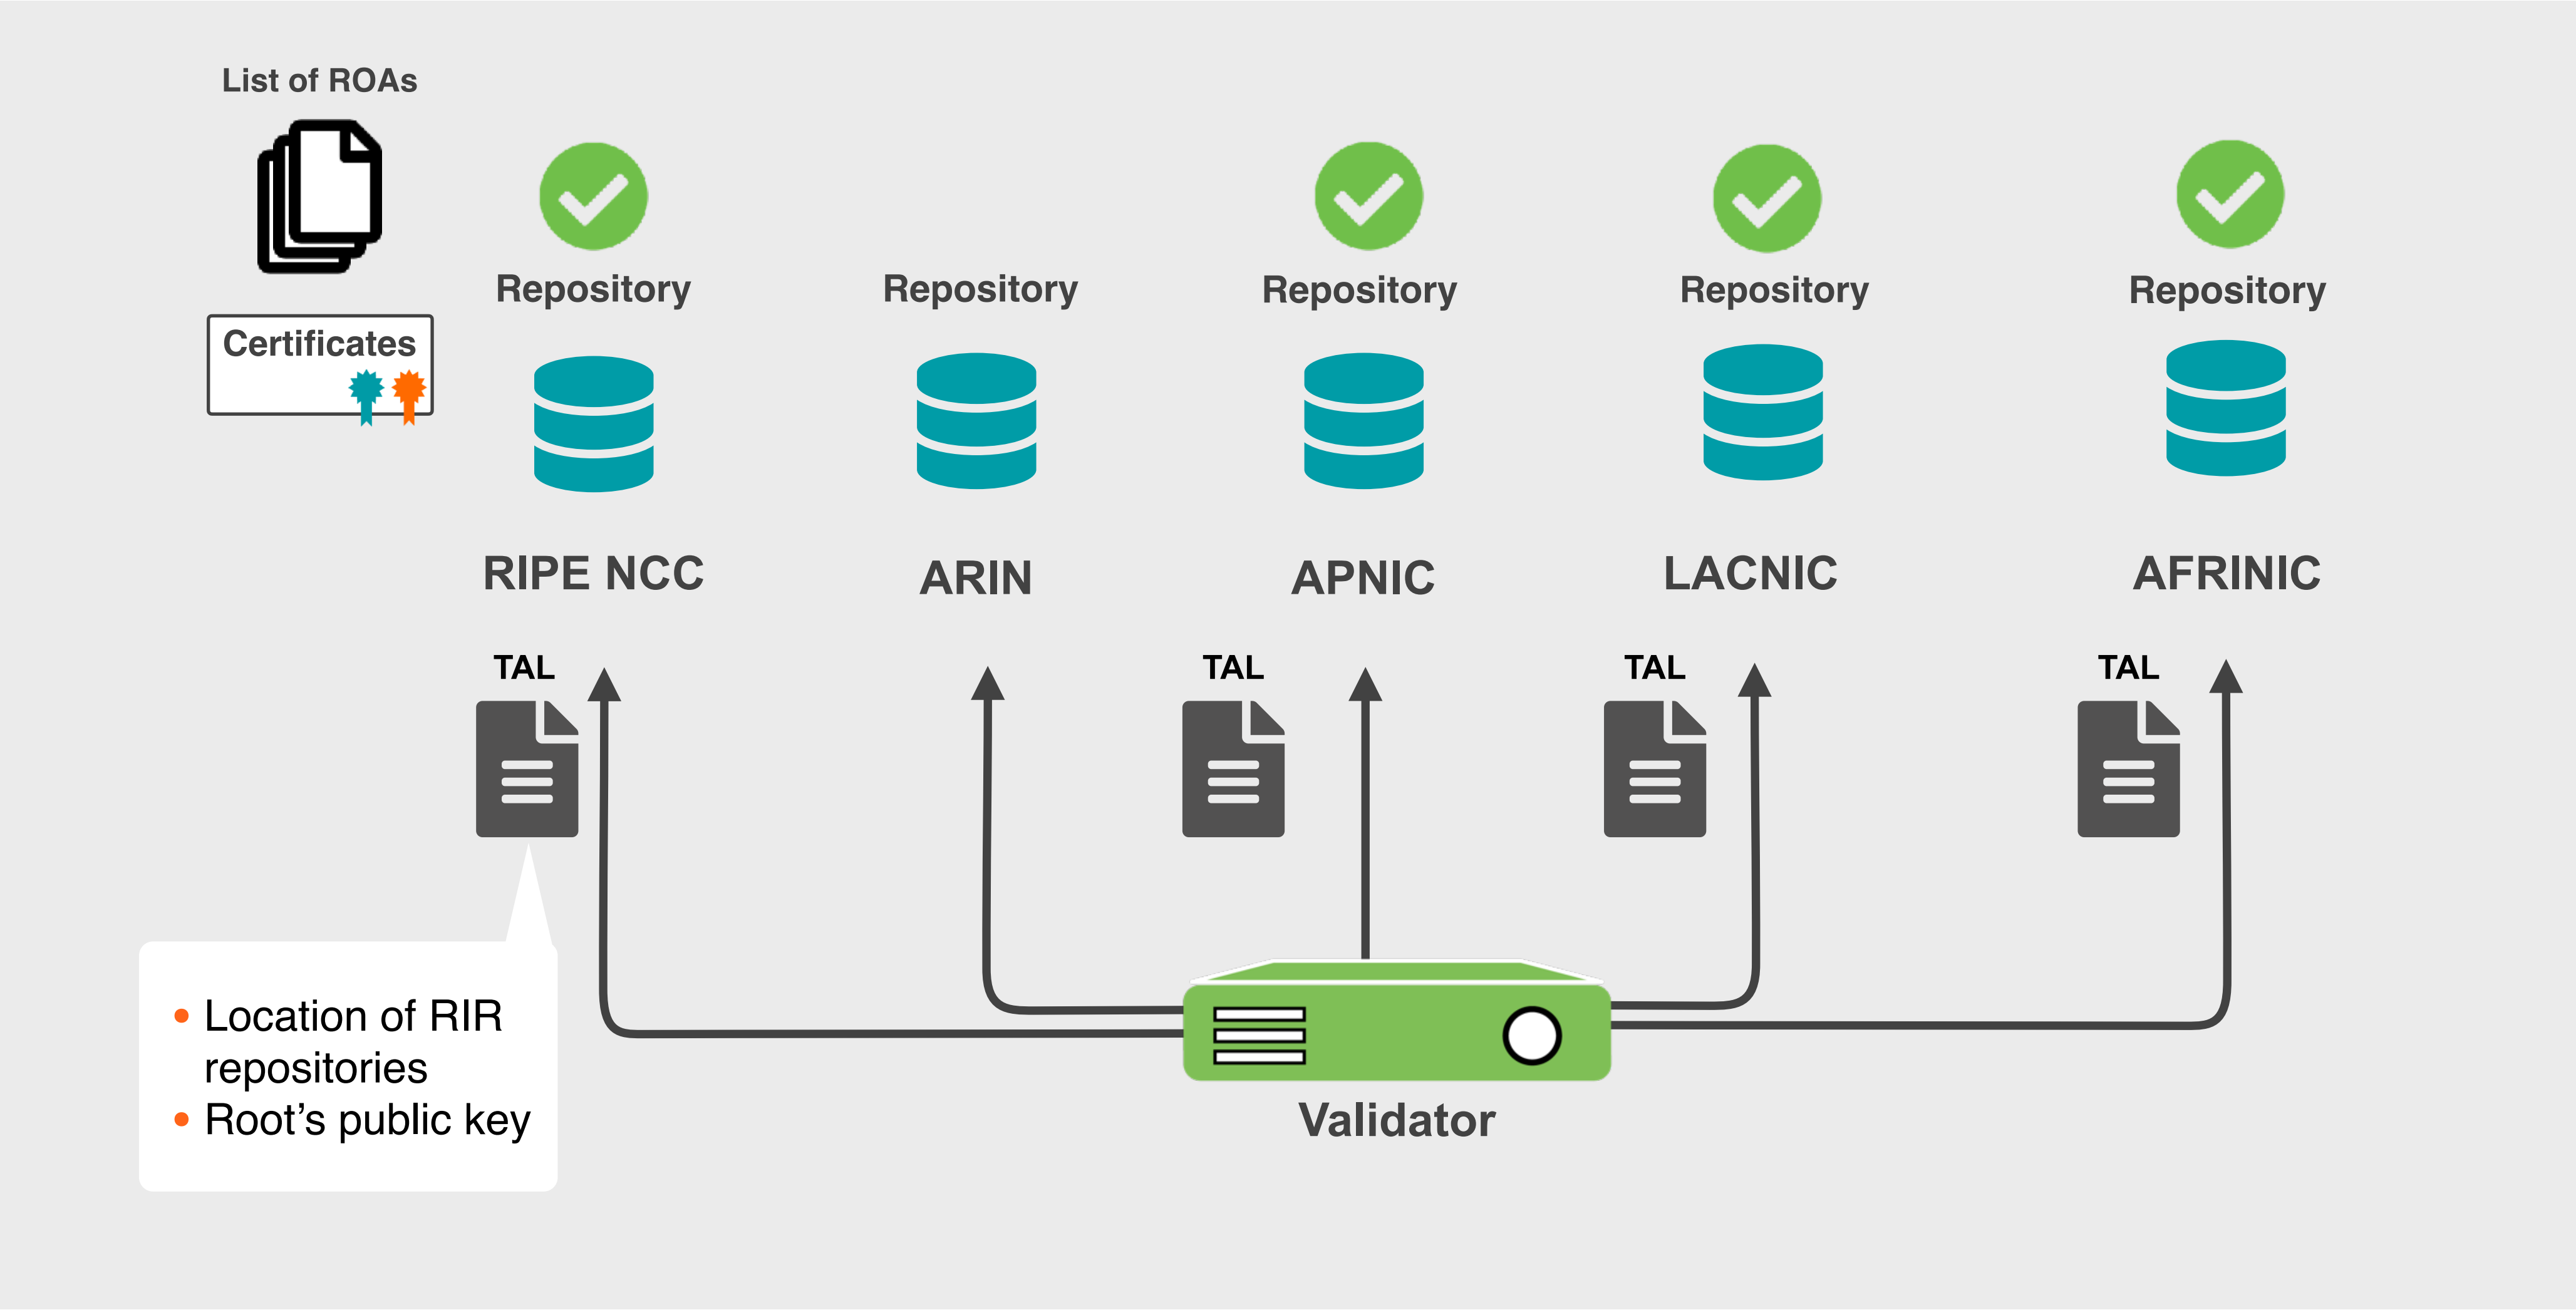

# RPKI Validators

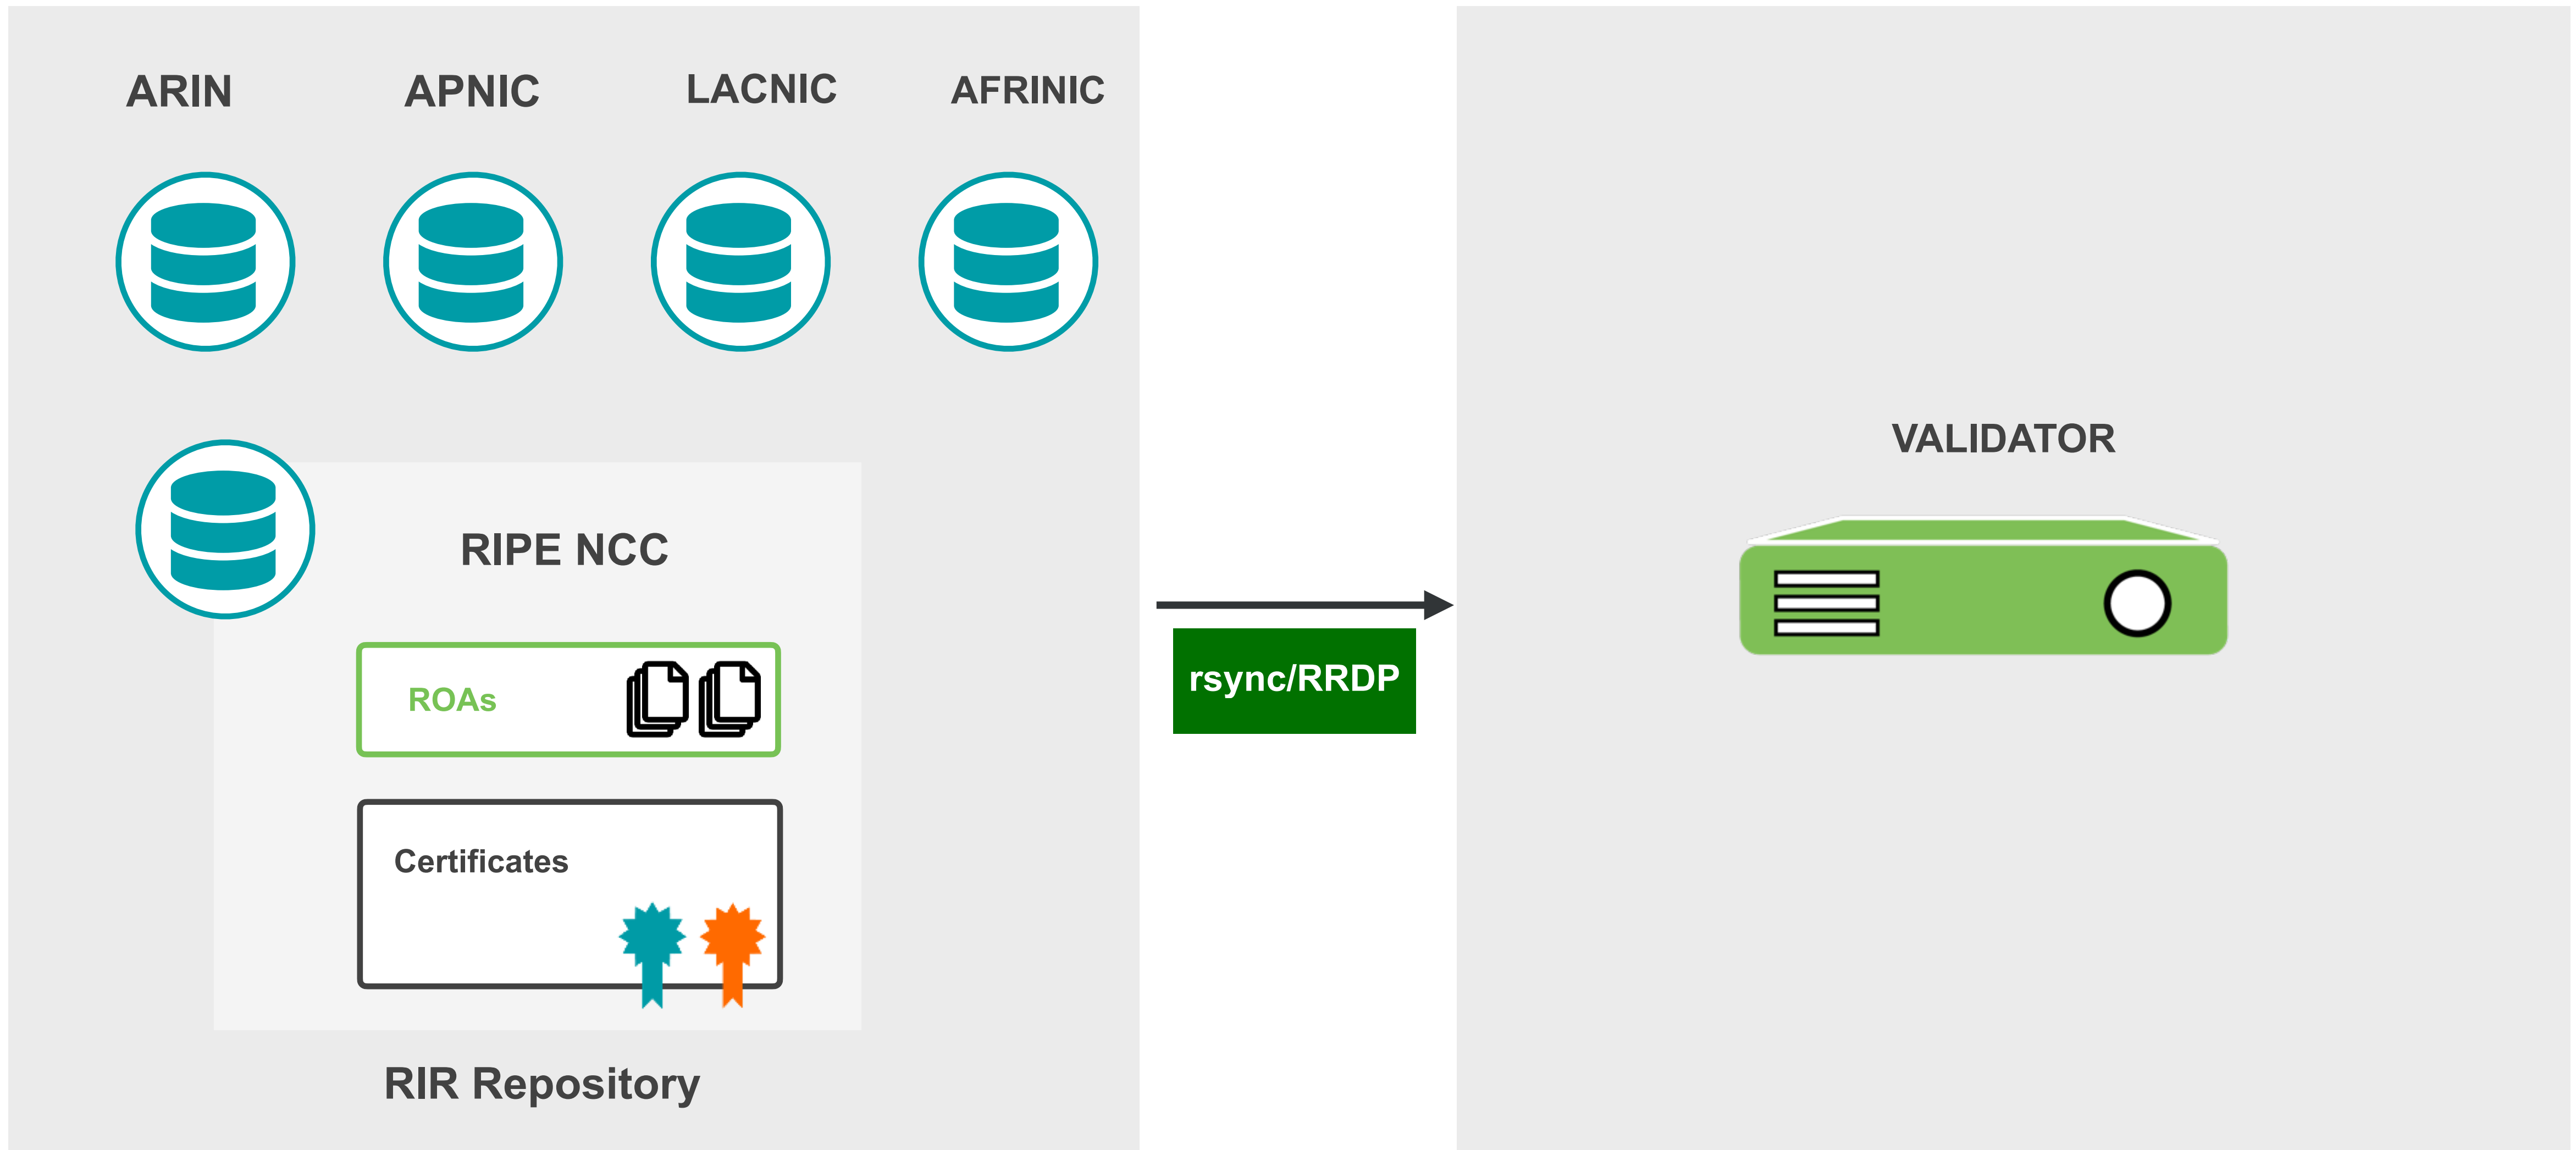

- Also known as **Relying Party Software**
- Download the RPKI repositories from RIRs
- Validate the chain of trust for all ROAs and associated CAs
- Create a local “**validated cache**” with all the **valid ROAs**
- Talk to routers using RPKI-RTR Protocol

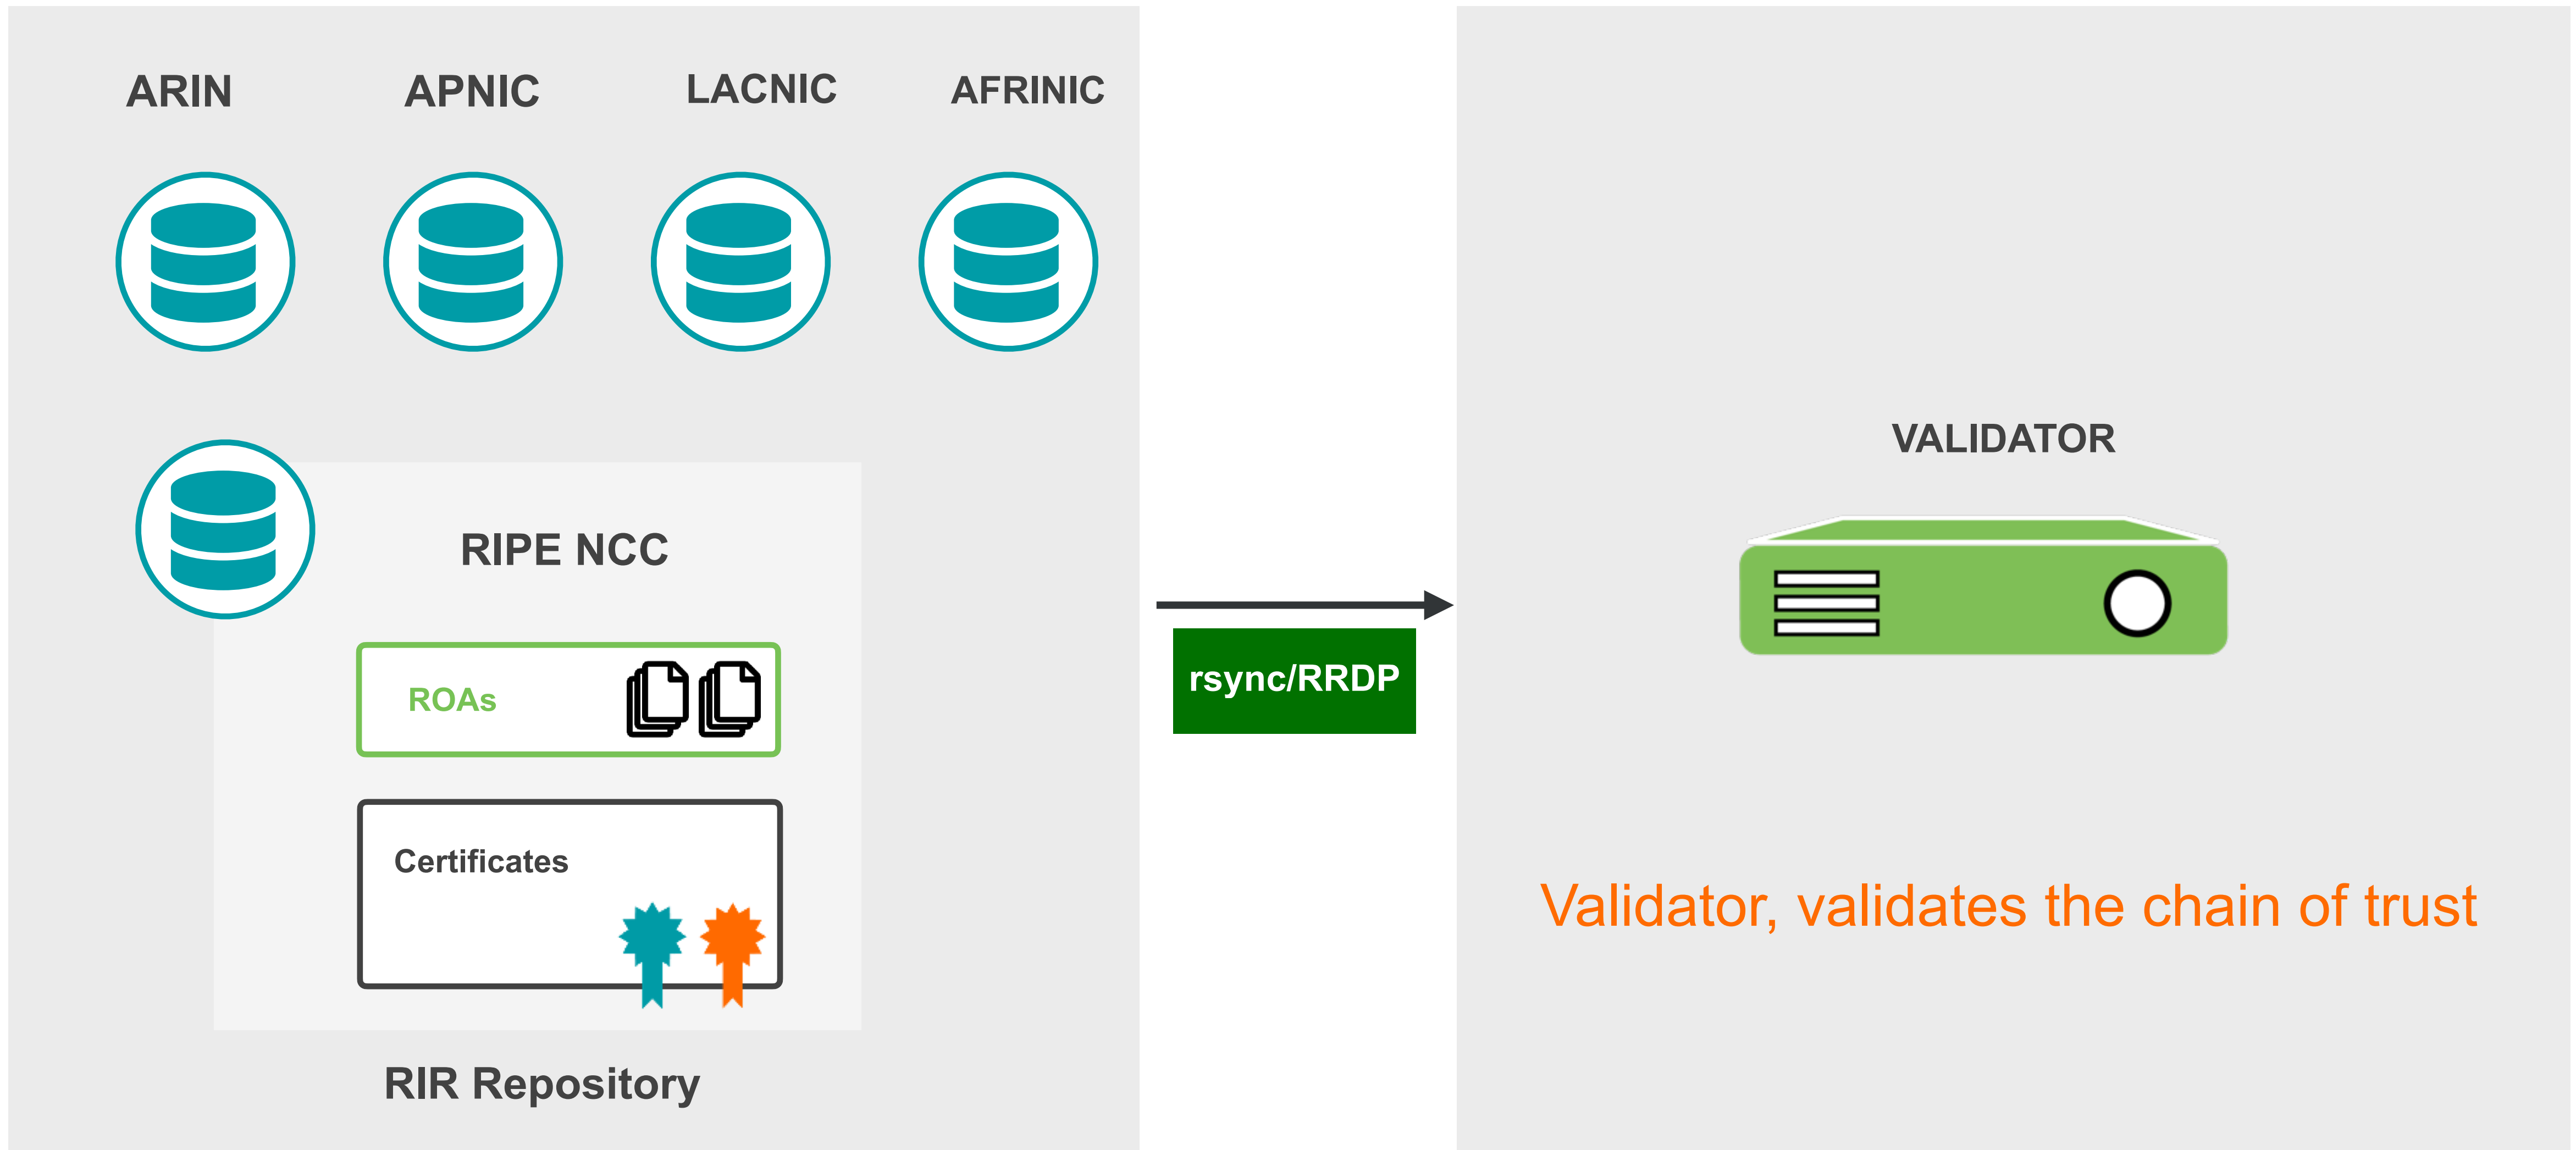

# Trust Anchor Locator (TAL)

# RPKI Validators

# RPKI Validators

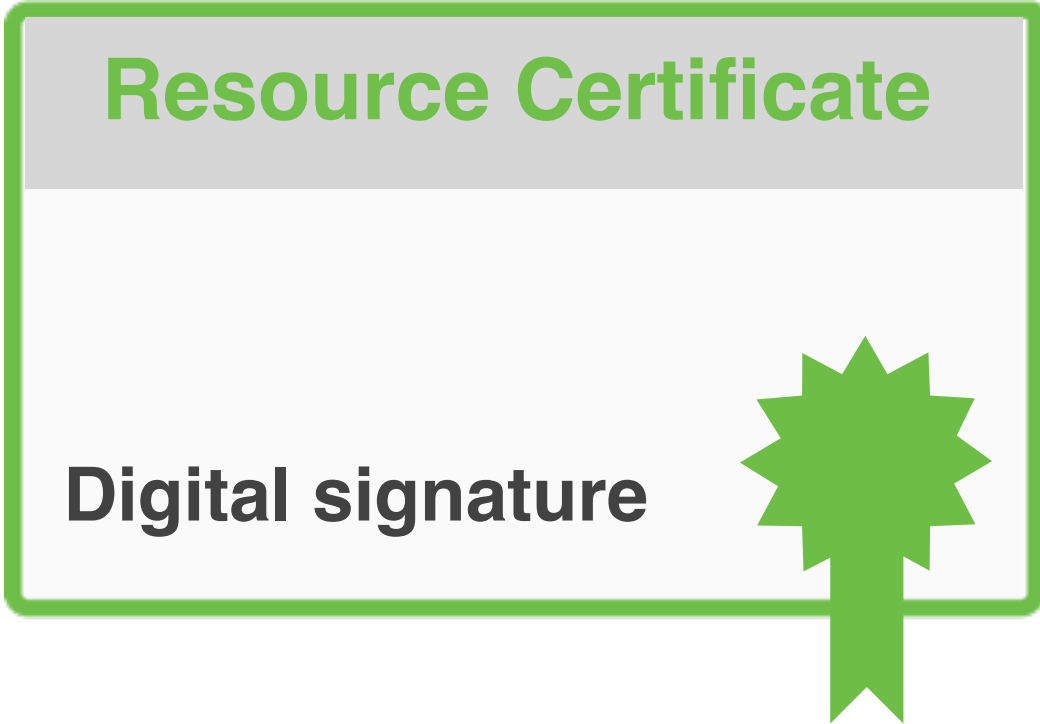

# ROA Validation Process

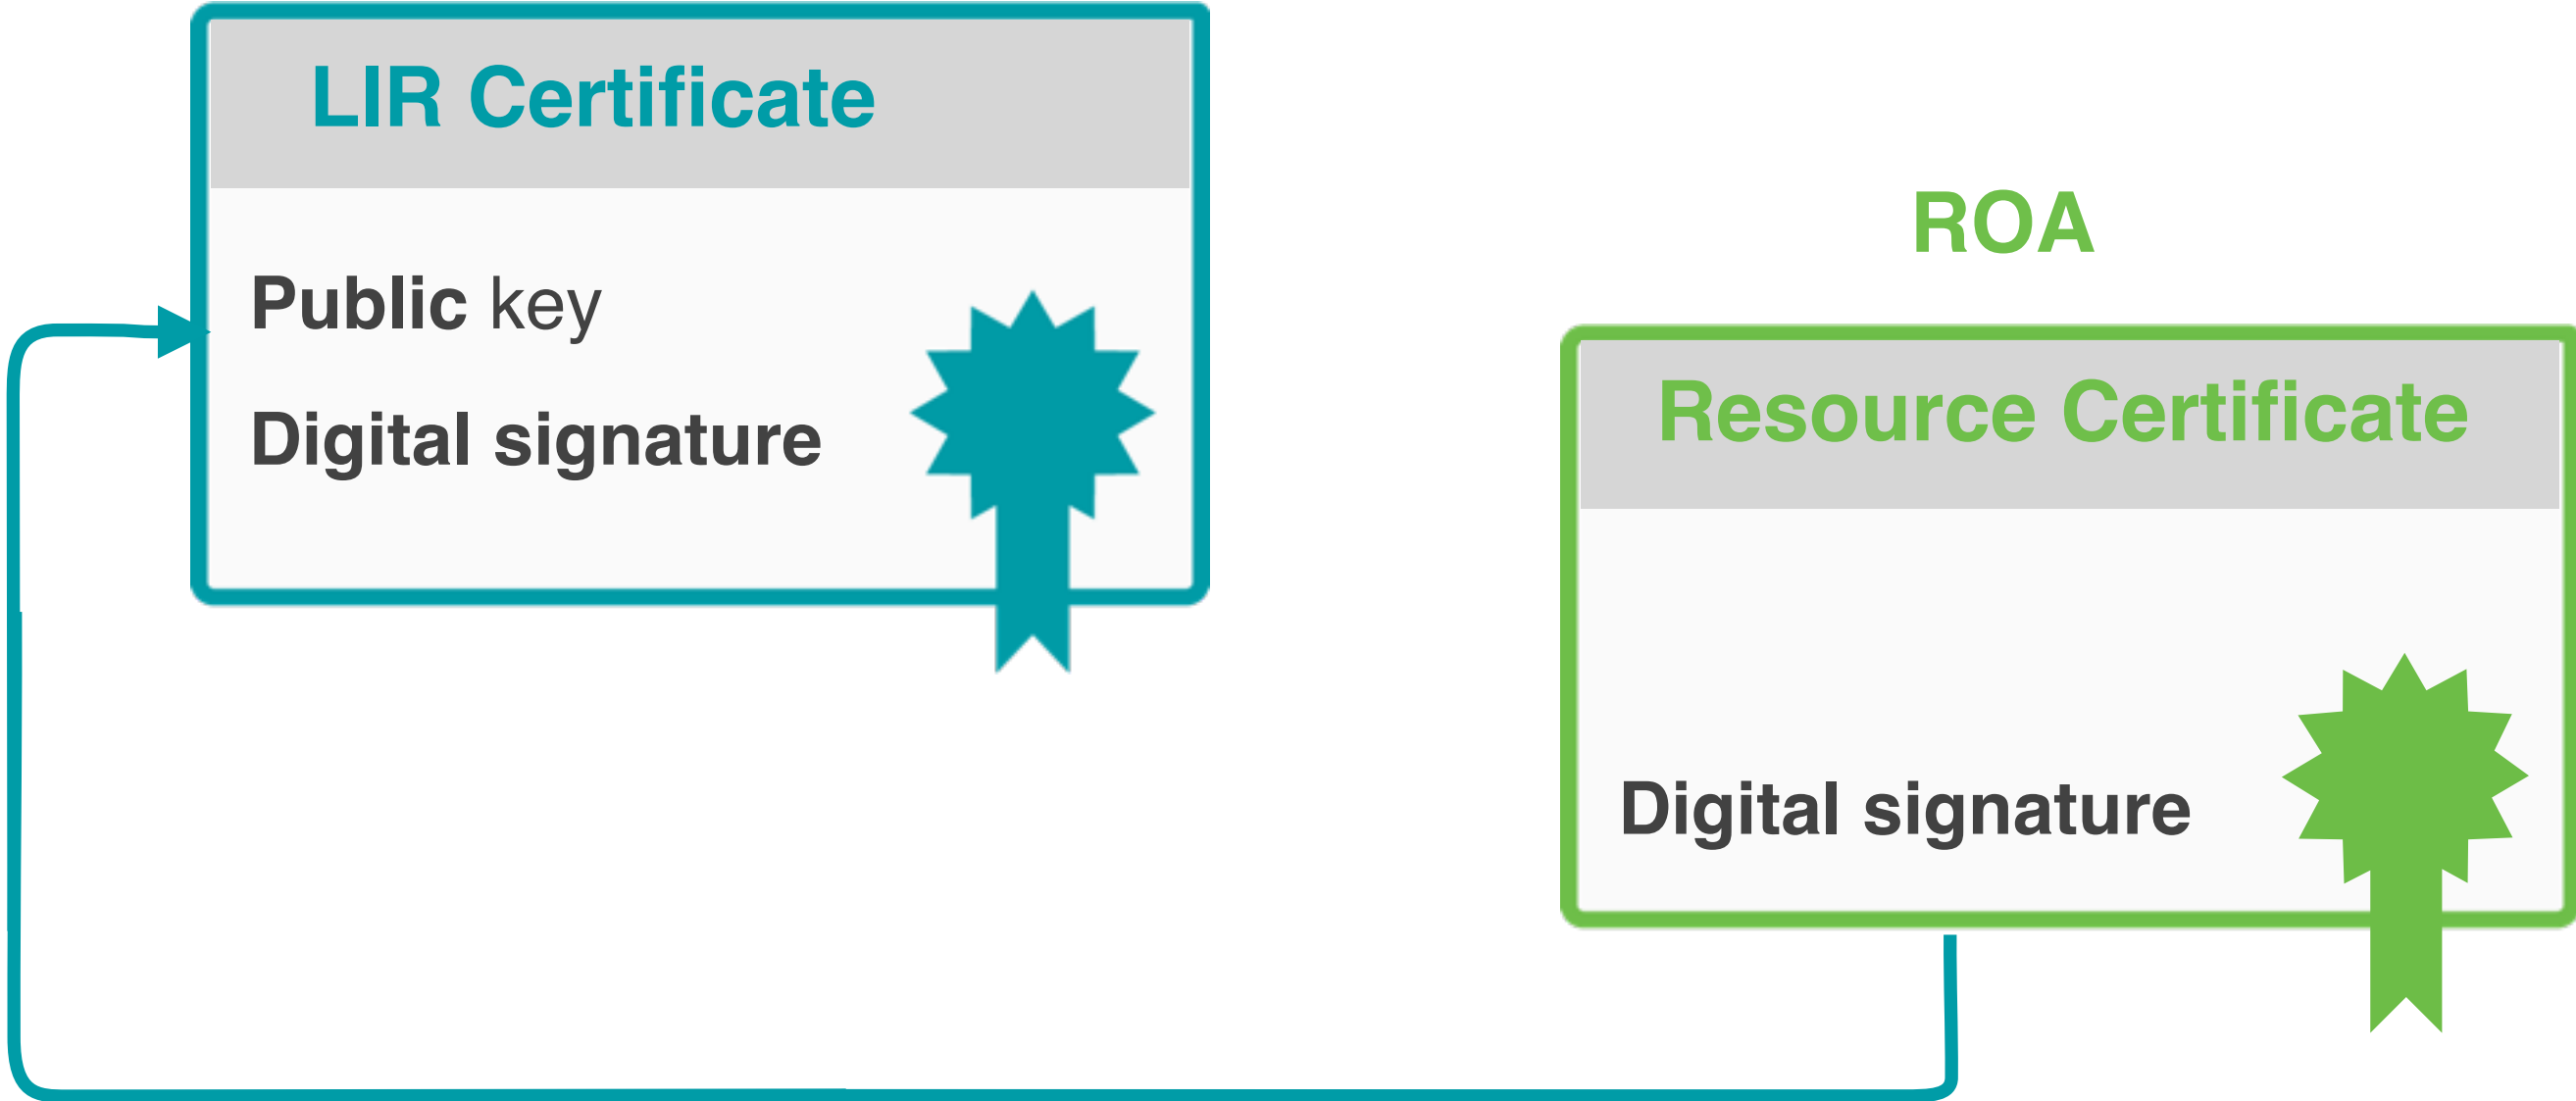

# ROA Validation Process

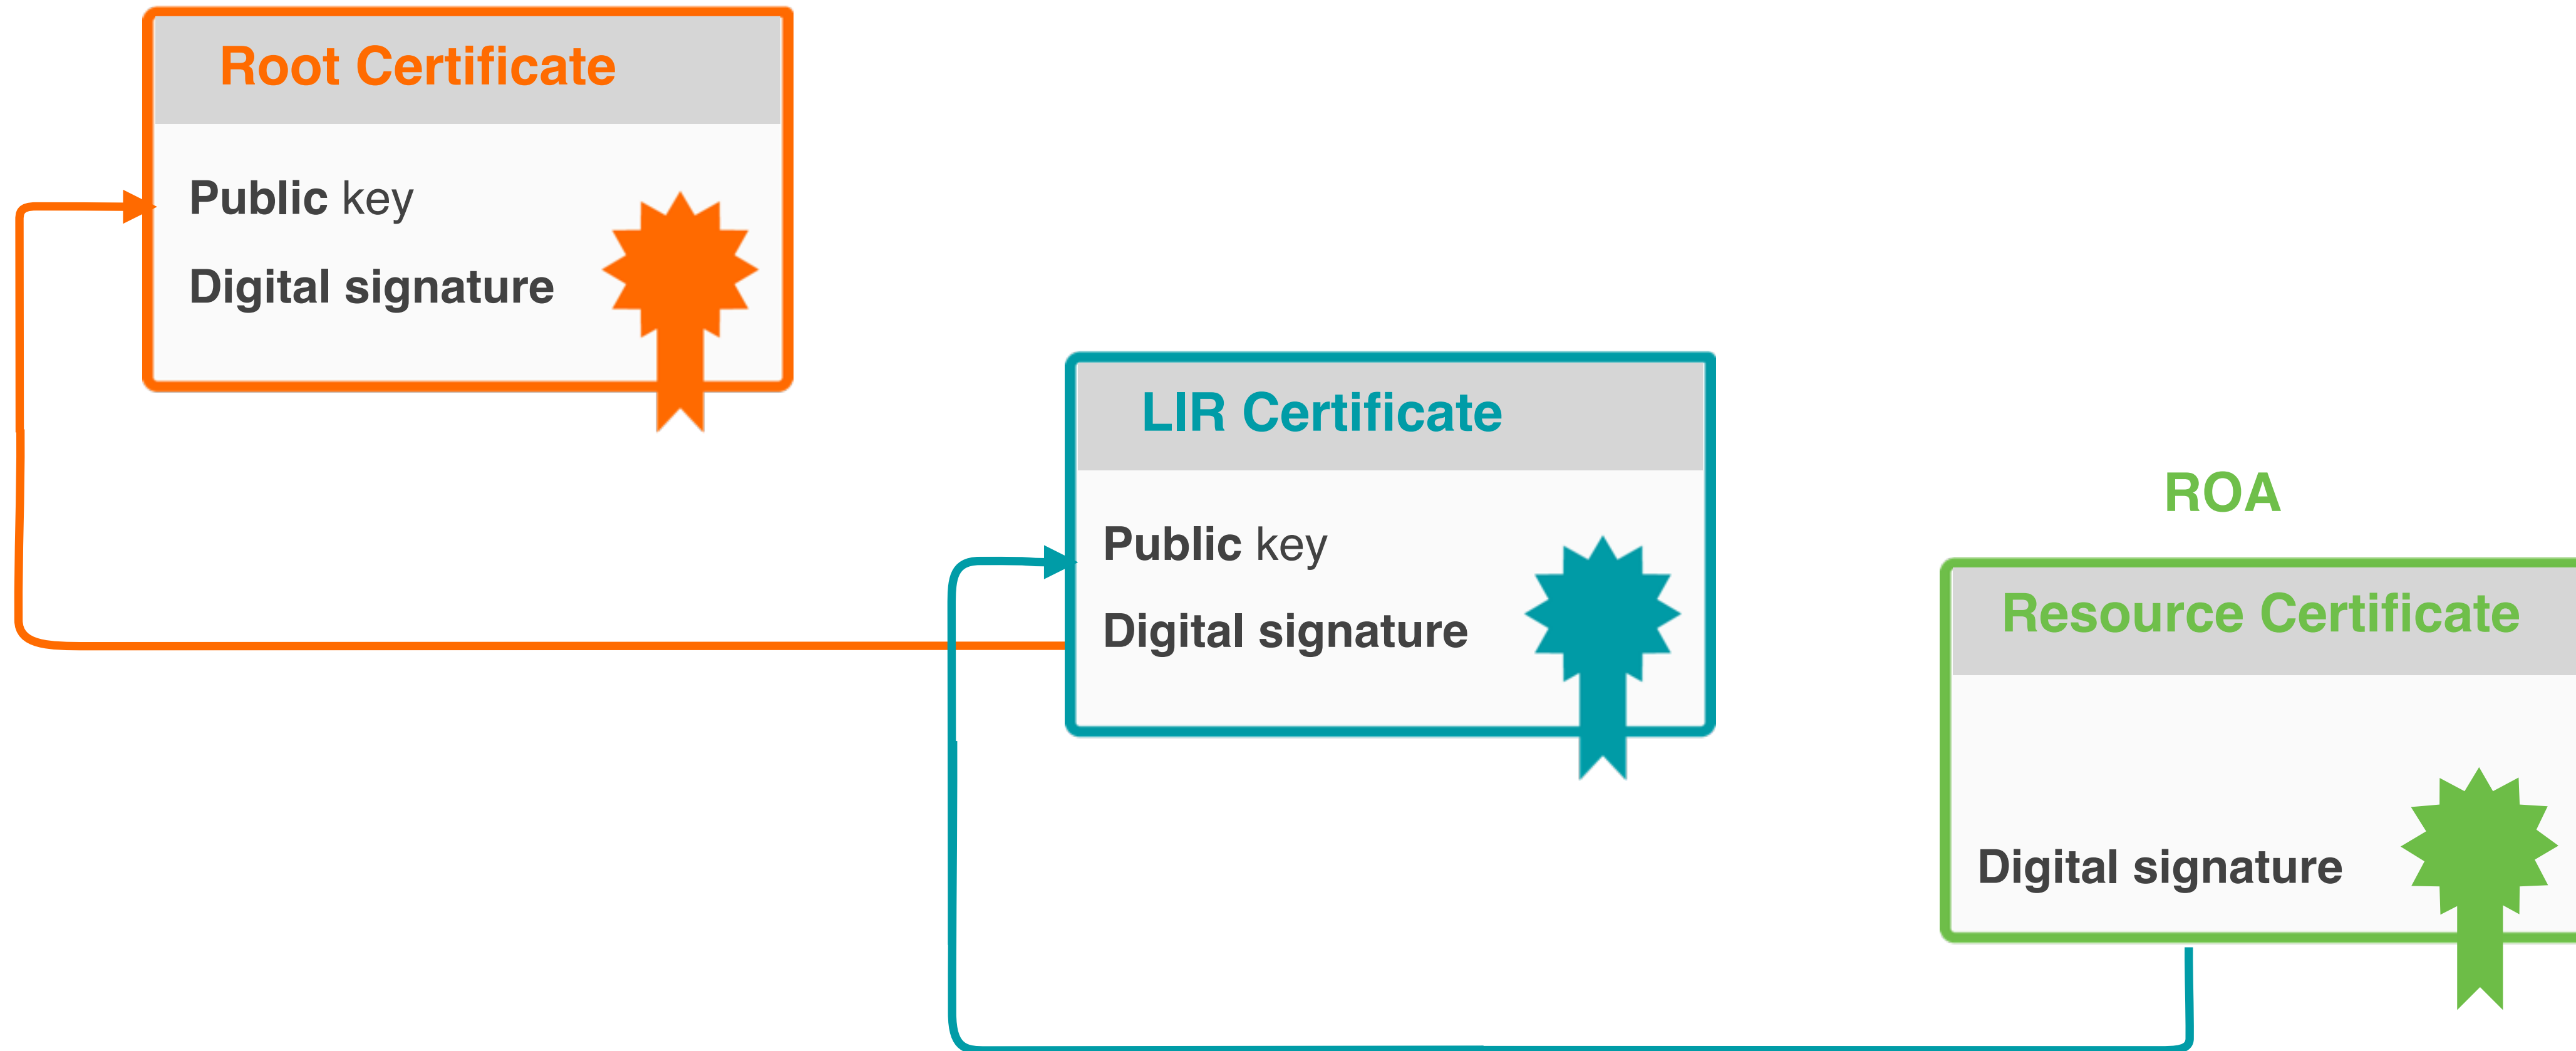

ROA

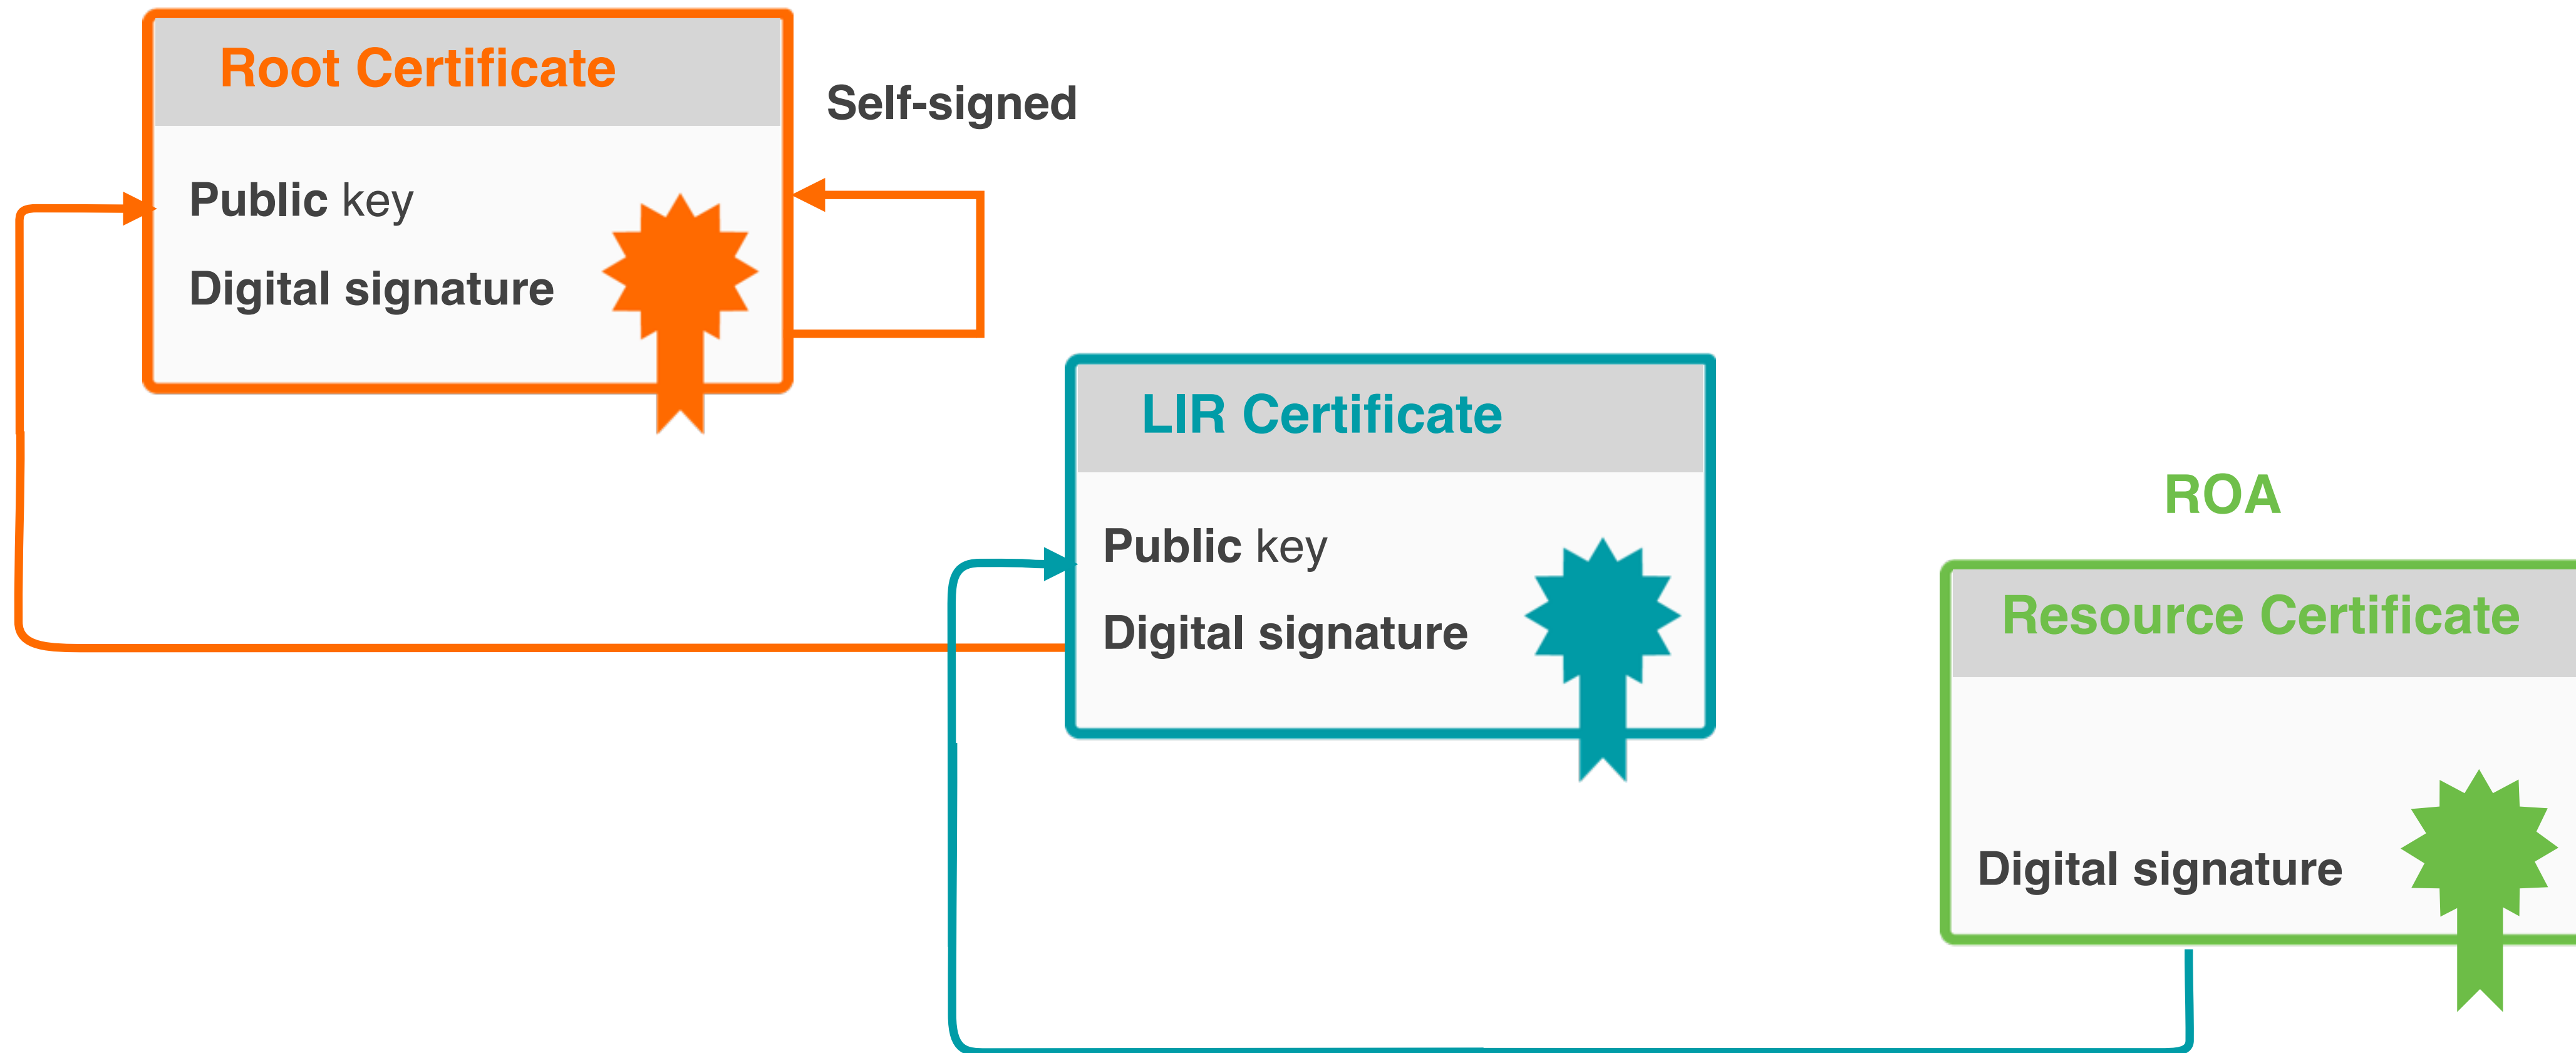

# ROA Validation Process

# ROA Validation Process

# ROA Validation Process

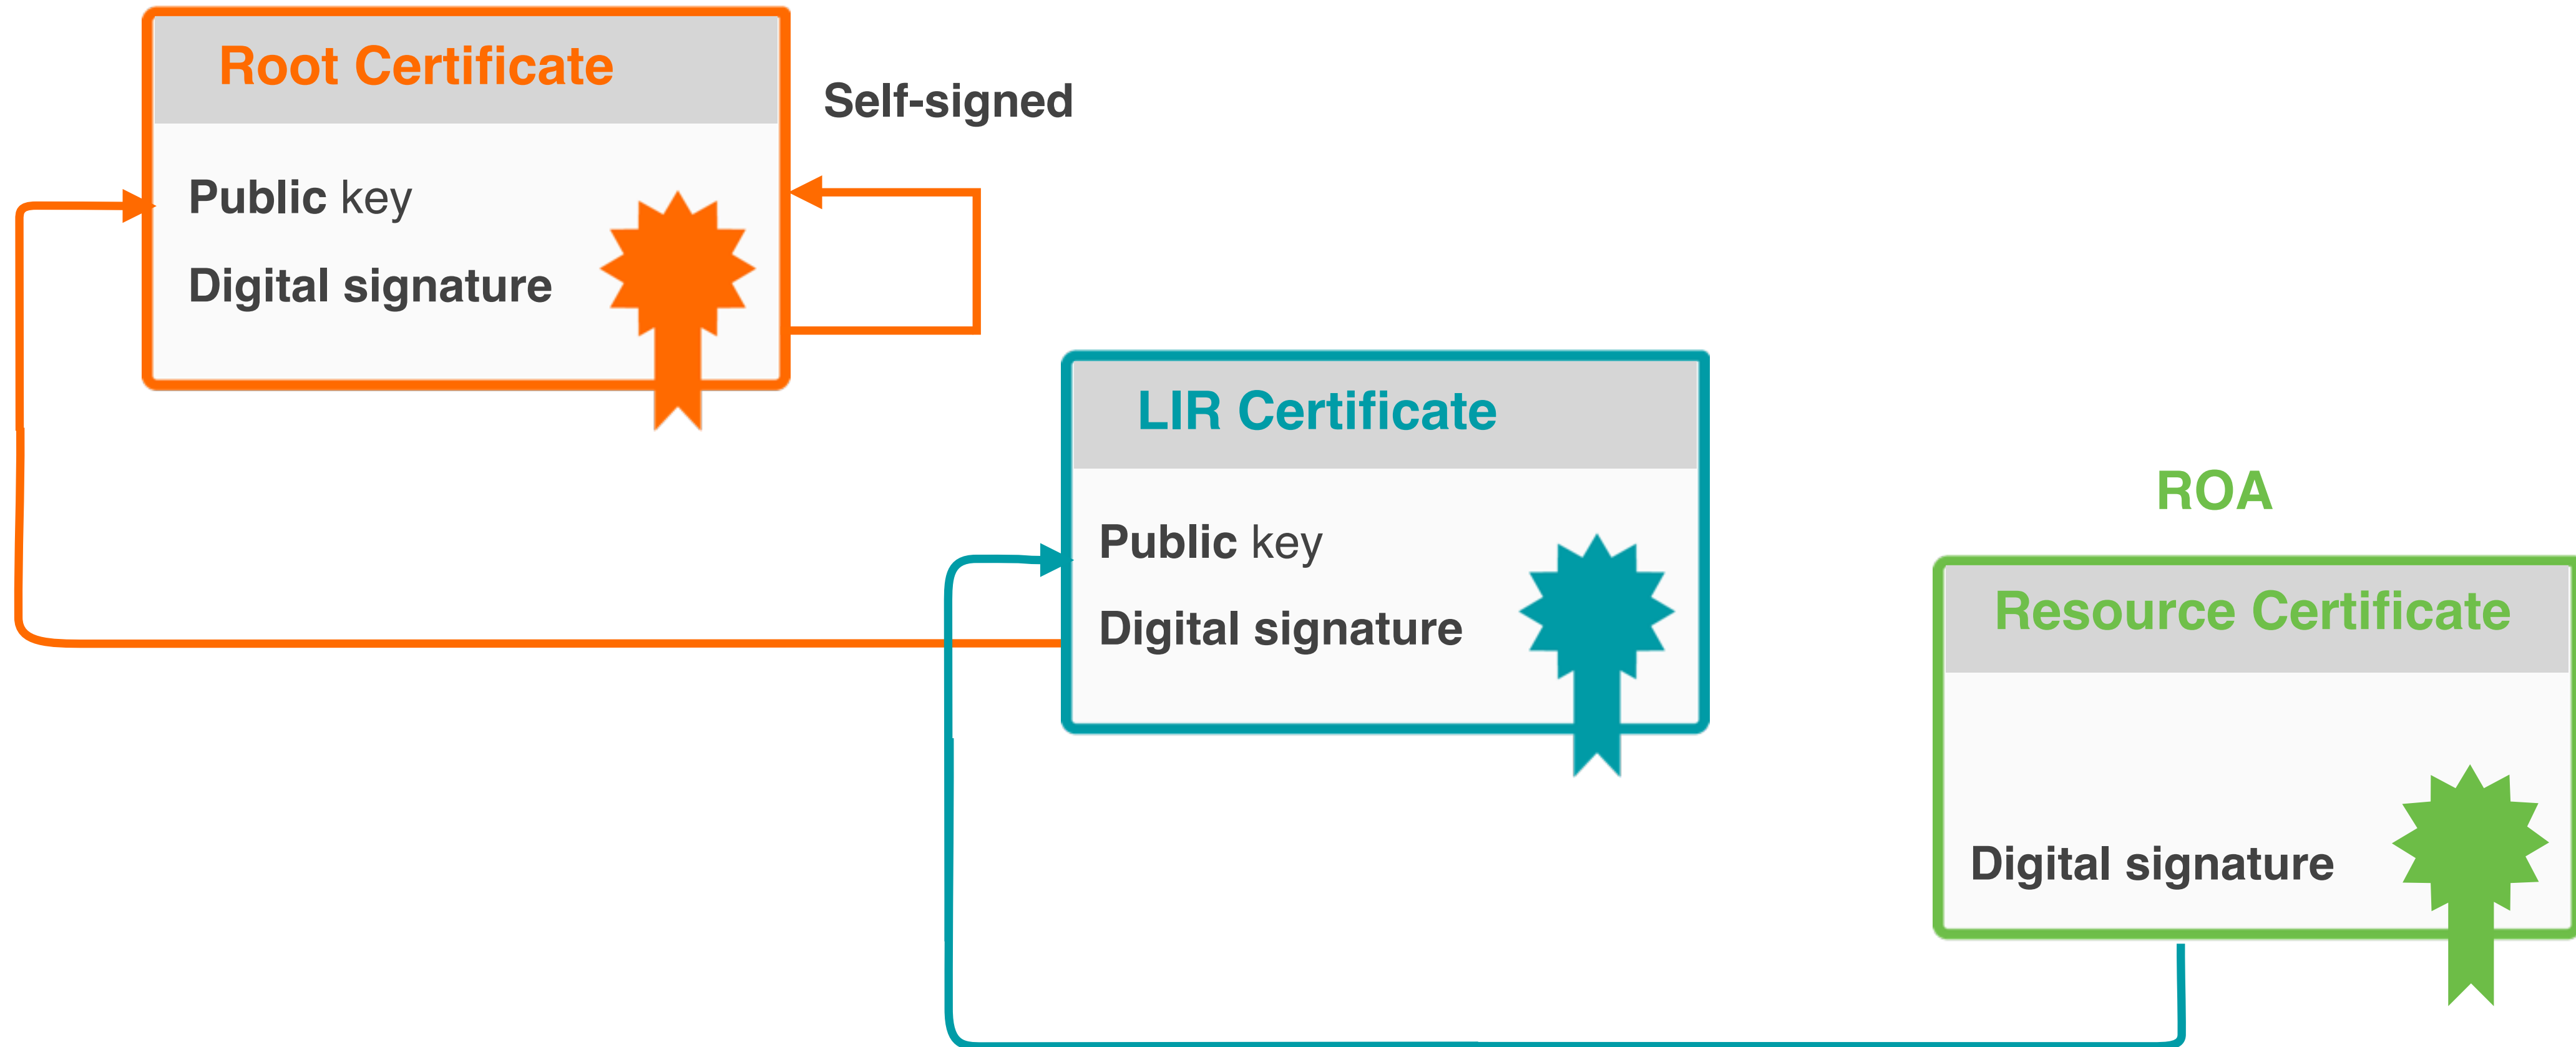

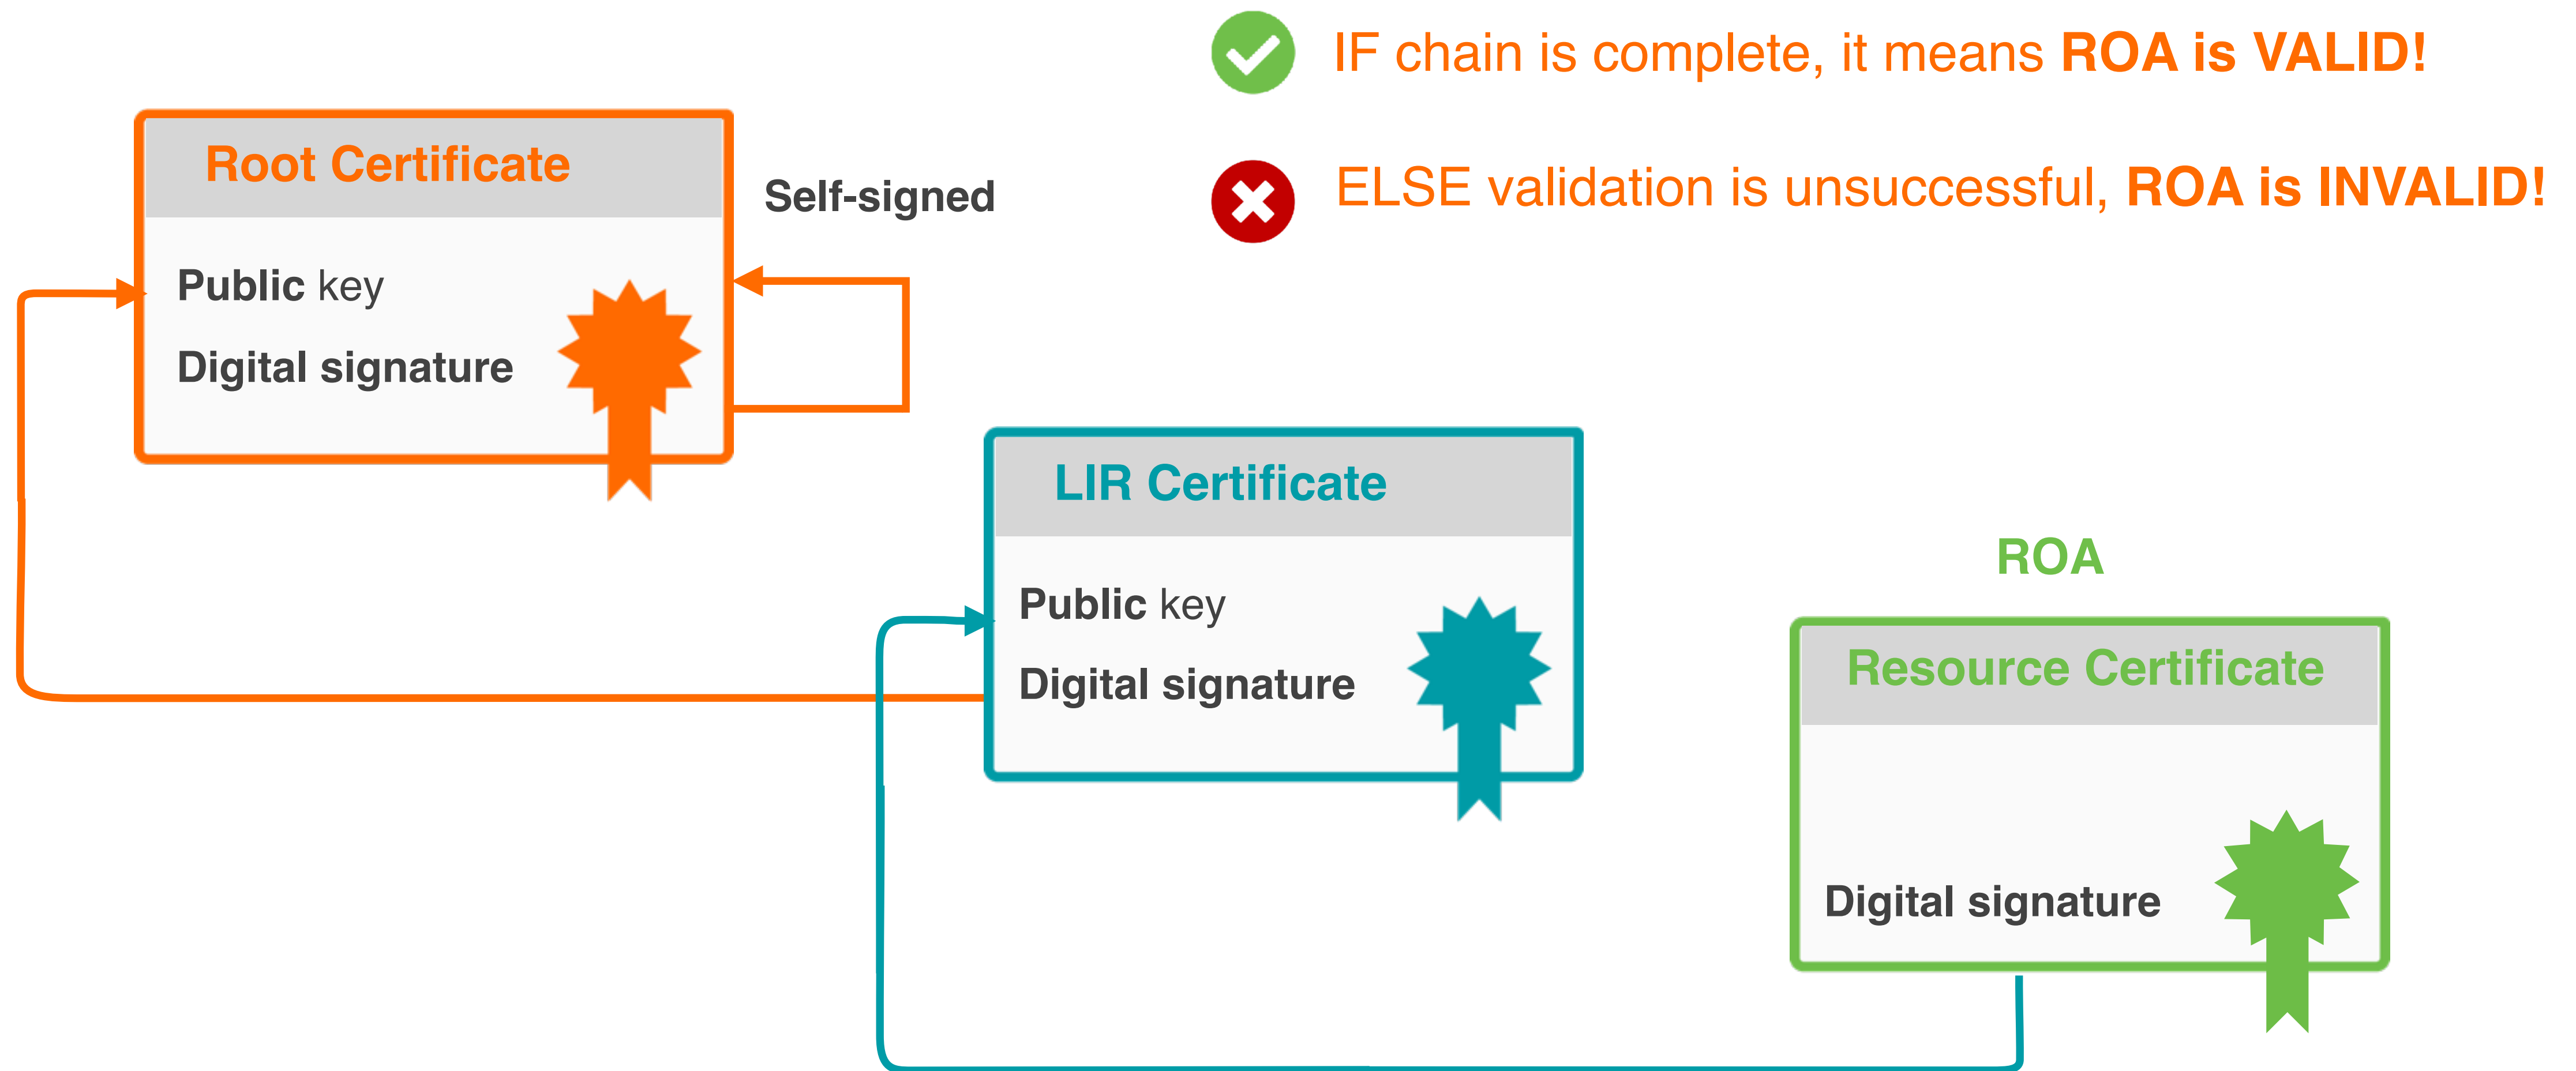

# ROA Validation Process

✓ IF chain is complete, it means **ROA is VALID!**

# ROA Validation Process

Only **valid ROAs** are sent to the router!

# RPKI Validator Options

- **Routinator**
  - Built by NLNet Labs
- **OctoRPKI**
  - Cloudflare's relying party software
- **FORT**
  - Open-source RPKI validator
- **rpki-client**
  - Integrated in OpenBSD

## Links for RPKI Validators

# Questions

# Demo!

## Running Validators

# How to Run Validators

- Run at least **two** validators
- Configure the **correct TALs**
  - TALs are freely available with validator software
  - Only the ARIN TAL needs to be installed separately
- In the demo, the following validators will be used:
  - Routinator (0.8.2)
  - FORT (1.4.2)
- Validators are already installed and preconfigured

# Start the Routinator

On the server:

```
routinator server --rtr 100.64.1.1:3323
```

The TAL directory is **missing!**

We need to initialise via the **init command!**

```
[root@server1 ~]# routinator server --rtr 100.64.1.1:3323
Missing TAL directory /root/.rpki-cache/tals.
You may have to initialize it via 'routinator init'.
```

```
[root@server1 ~]# routinator init
Before we can install the ARIN TAL, you must have read
and agree to the ARIN Relying Party Agreement (RPA).
It is available at
```

```
https://www.arin.net/resources/manage/rpki/rpa.pdf
```

```
If you agree to the RPA, please run the command
again with the --accept-arin-rpa option.
```

```
[root@server1 ~]# routinator init --accept-arin-rpa
Created local repository directory /root/.rpki-cache/repository
Installed 5 TALs in /root/.rpki-cache/tals
```

# Start the Routinator

On the server:

```
routinator server --rtr 100.64.1.1:3323
```

Check if it's running:

```
ps aux | grep routinator
```

```
[root@server1 ~]# routinator -v vrps | grep 193.0.24.0/21
rsyncing from rsync://localcert.ripe.net/ta/.
rsync://localcert.ripe.net/ta: successfully completed.
rsync://localcert.ripe.net/ta: The RIPE NCC Certification Repository is
subject to Terms and Conditions
rsync://localcert.ripe.net/ta: See http://www.ripe.net/lir-services/ncc/
legal/certification/repository-tc
*
*
*
*
AS2121, 193.0.24.0/21, 21, ripe-ncc-pilot
[root@server1 ~]#
```

# Start FORT validator

On the server:

```
fort --init-tals -tal=/etc/fort/tal
```

```
[root@server1 ~]# fort --init-tals --tal=/etc/fort/tal
Please download and read ARIN Relying Party Agreement (RPA)
from https://www.arin.net/resources/manage/rpki/rpa.pdf. Once
you've read it and if you agree ARIN RPA, type 'yes' to
proceed with ARIN's TAL download:
```

**yes**

```
Successfully fetched '/etc/fort/tal/arin.tal'!
```

```
Successfully fetched '/etc/fort/tal/apnic.tal'!
```

```
Successfully fetched '/etc/fort/tal/afrinic.tal'!
```

```
Successfully fetched '/etc/fort/tal/ripe.tal'!
```

```
Successfully fetched '/etc/fort/tal/lacnic.tal'!
```

# Start FORT validator

On the server:

```
systemctl start fort
```

Check if it is running and the logs (exit with ctrl-c):

```
Systemctl status fort
```

```
journalctl -u fort
```

# Verify FORT is listening

- FORT will not start RTR server before it does the validation for the first time
- It listens on port **323** by default
- Configuration is in **/etc/fort/config.json**

To check whether FORT is listening:

```
[root@server1 ~]# ss -tlnp | grep fort
LISTEN      0      128      100.64.1.1:323      *:*
users: ( ("fort", pid=1009, fd=4) )
```

```
root@server1 ~]# journalctl -u fort -f
-- Logs begin at Mon 2021-02-08 11:51:24 CET. --

Let's explain it with examples...

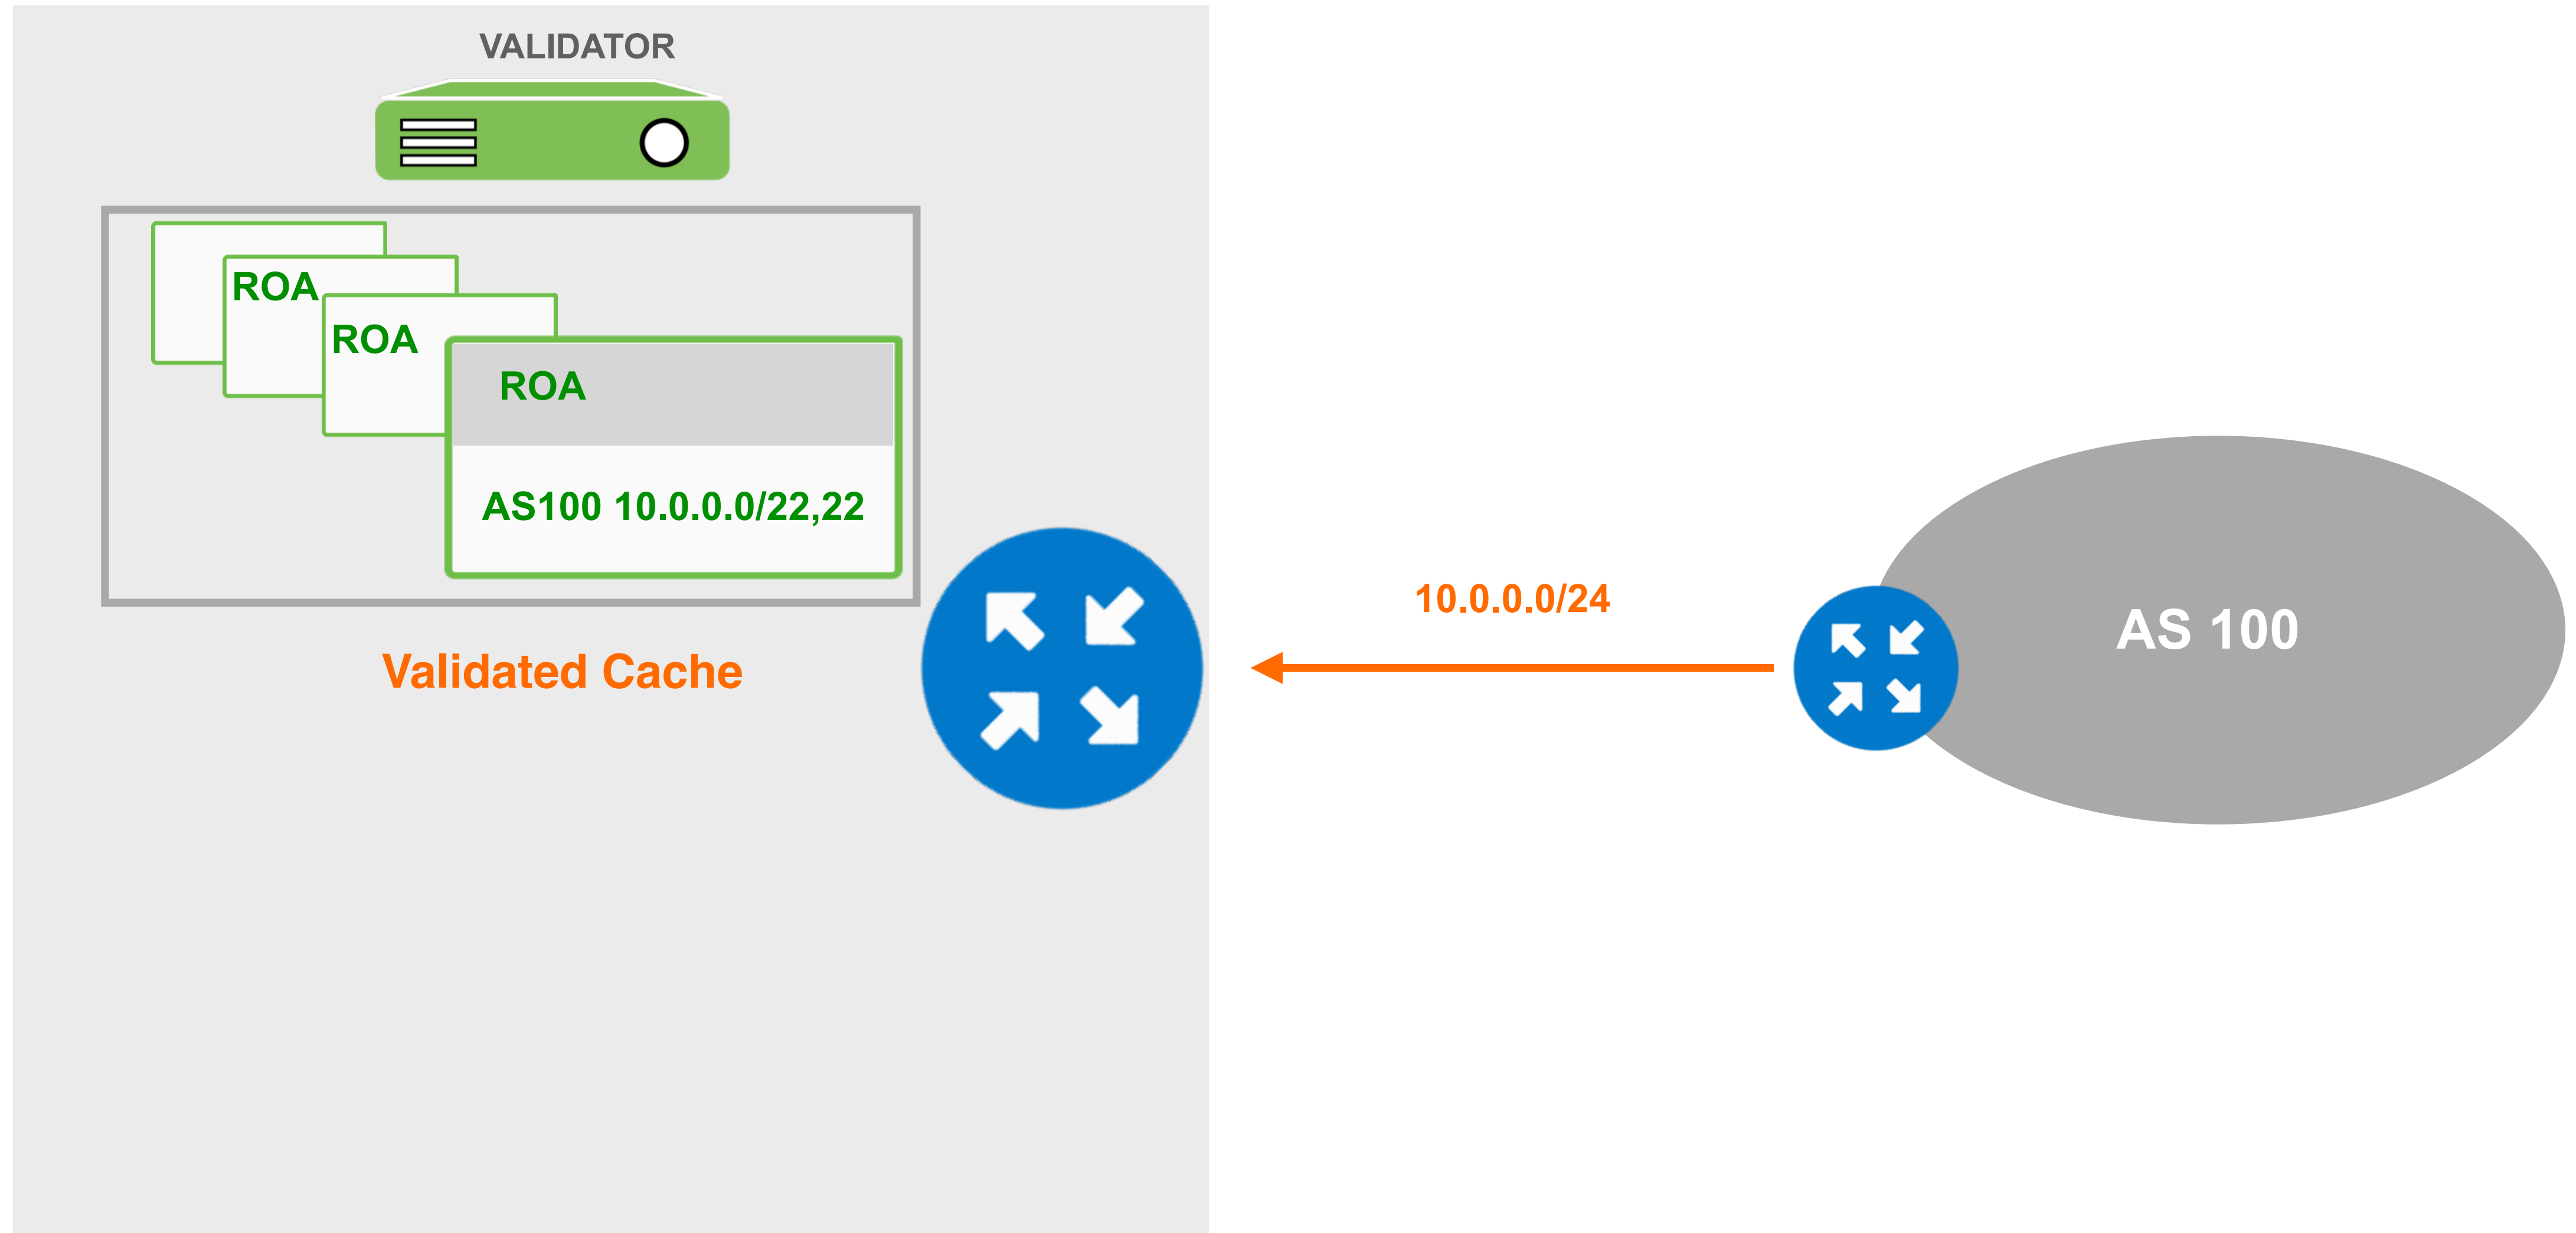

# BGP Valid

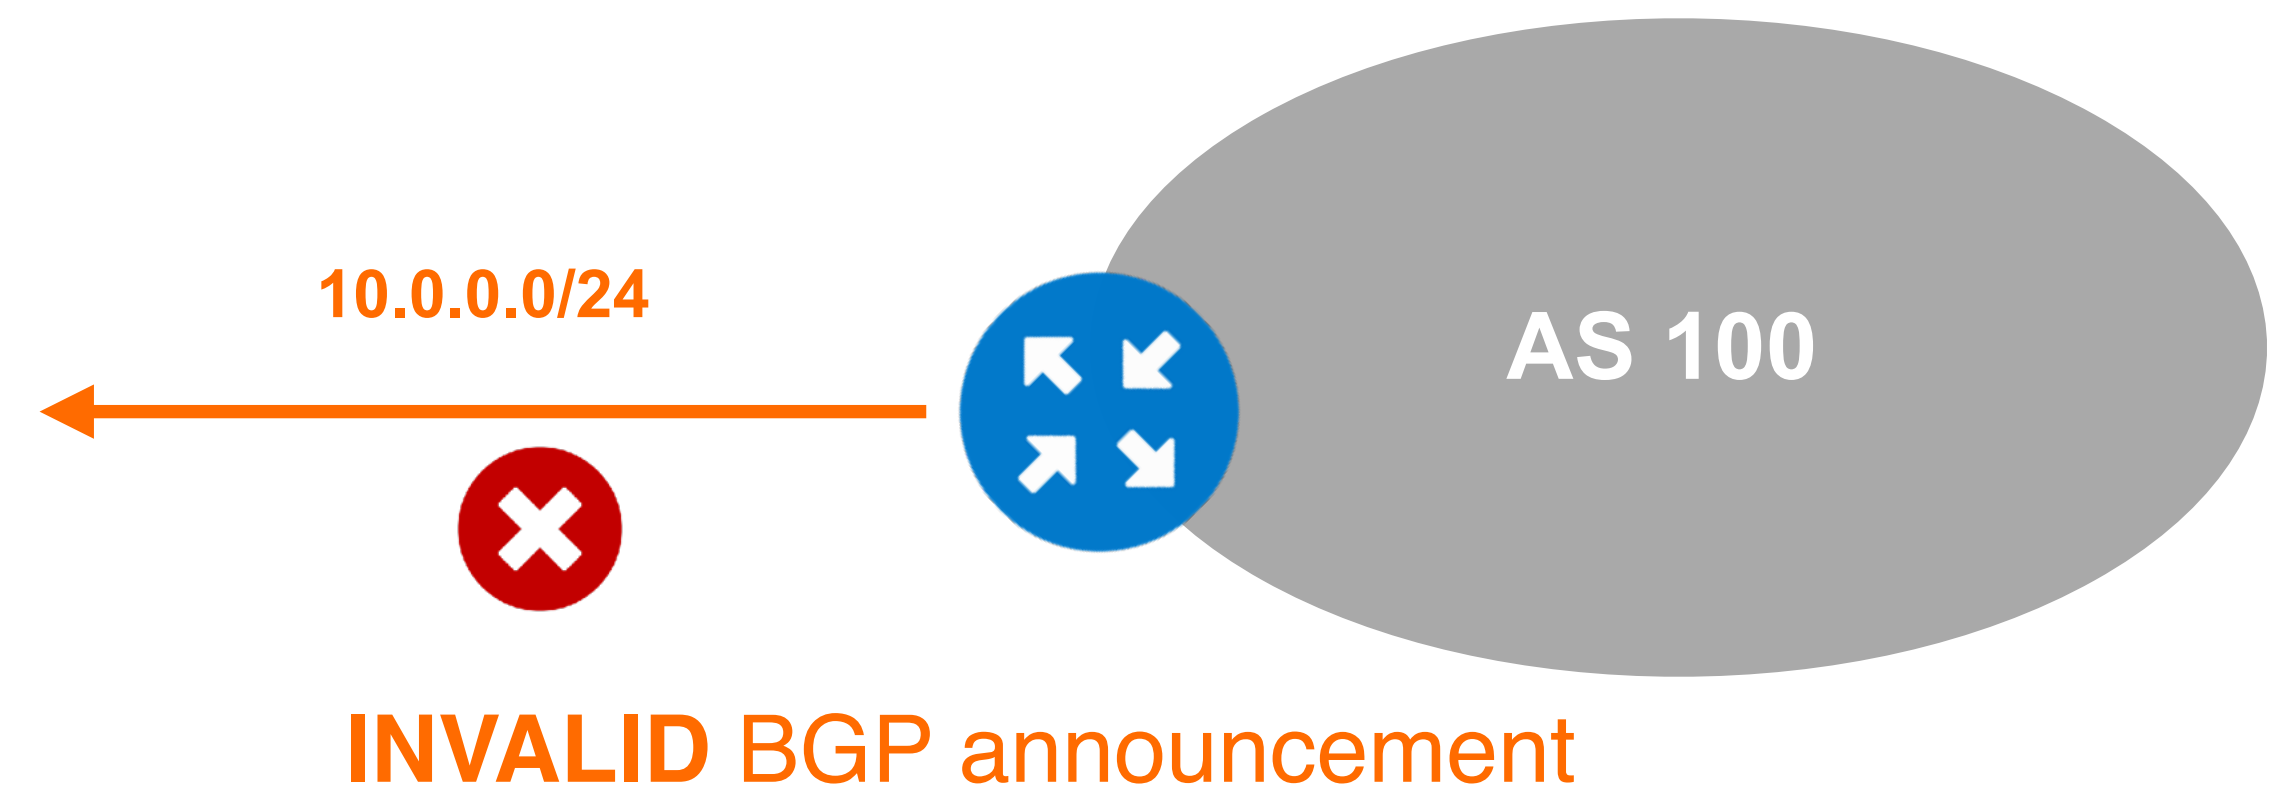

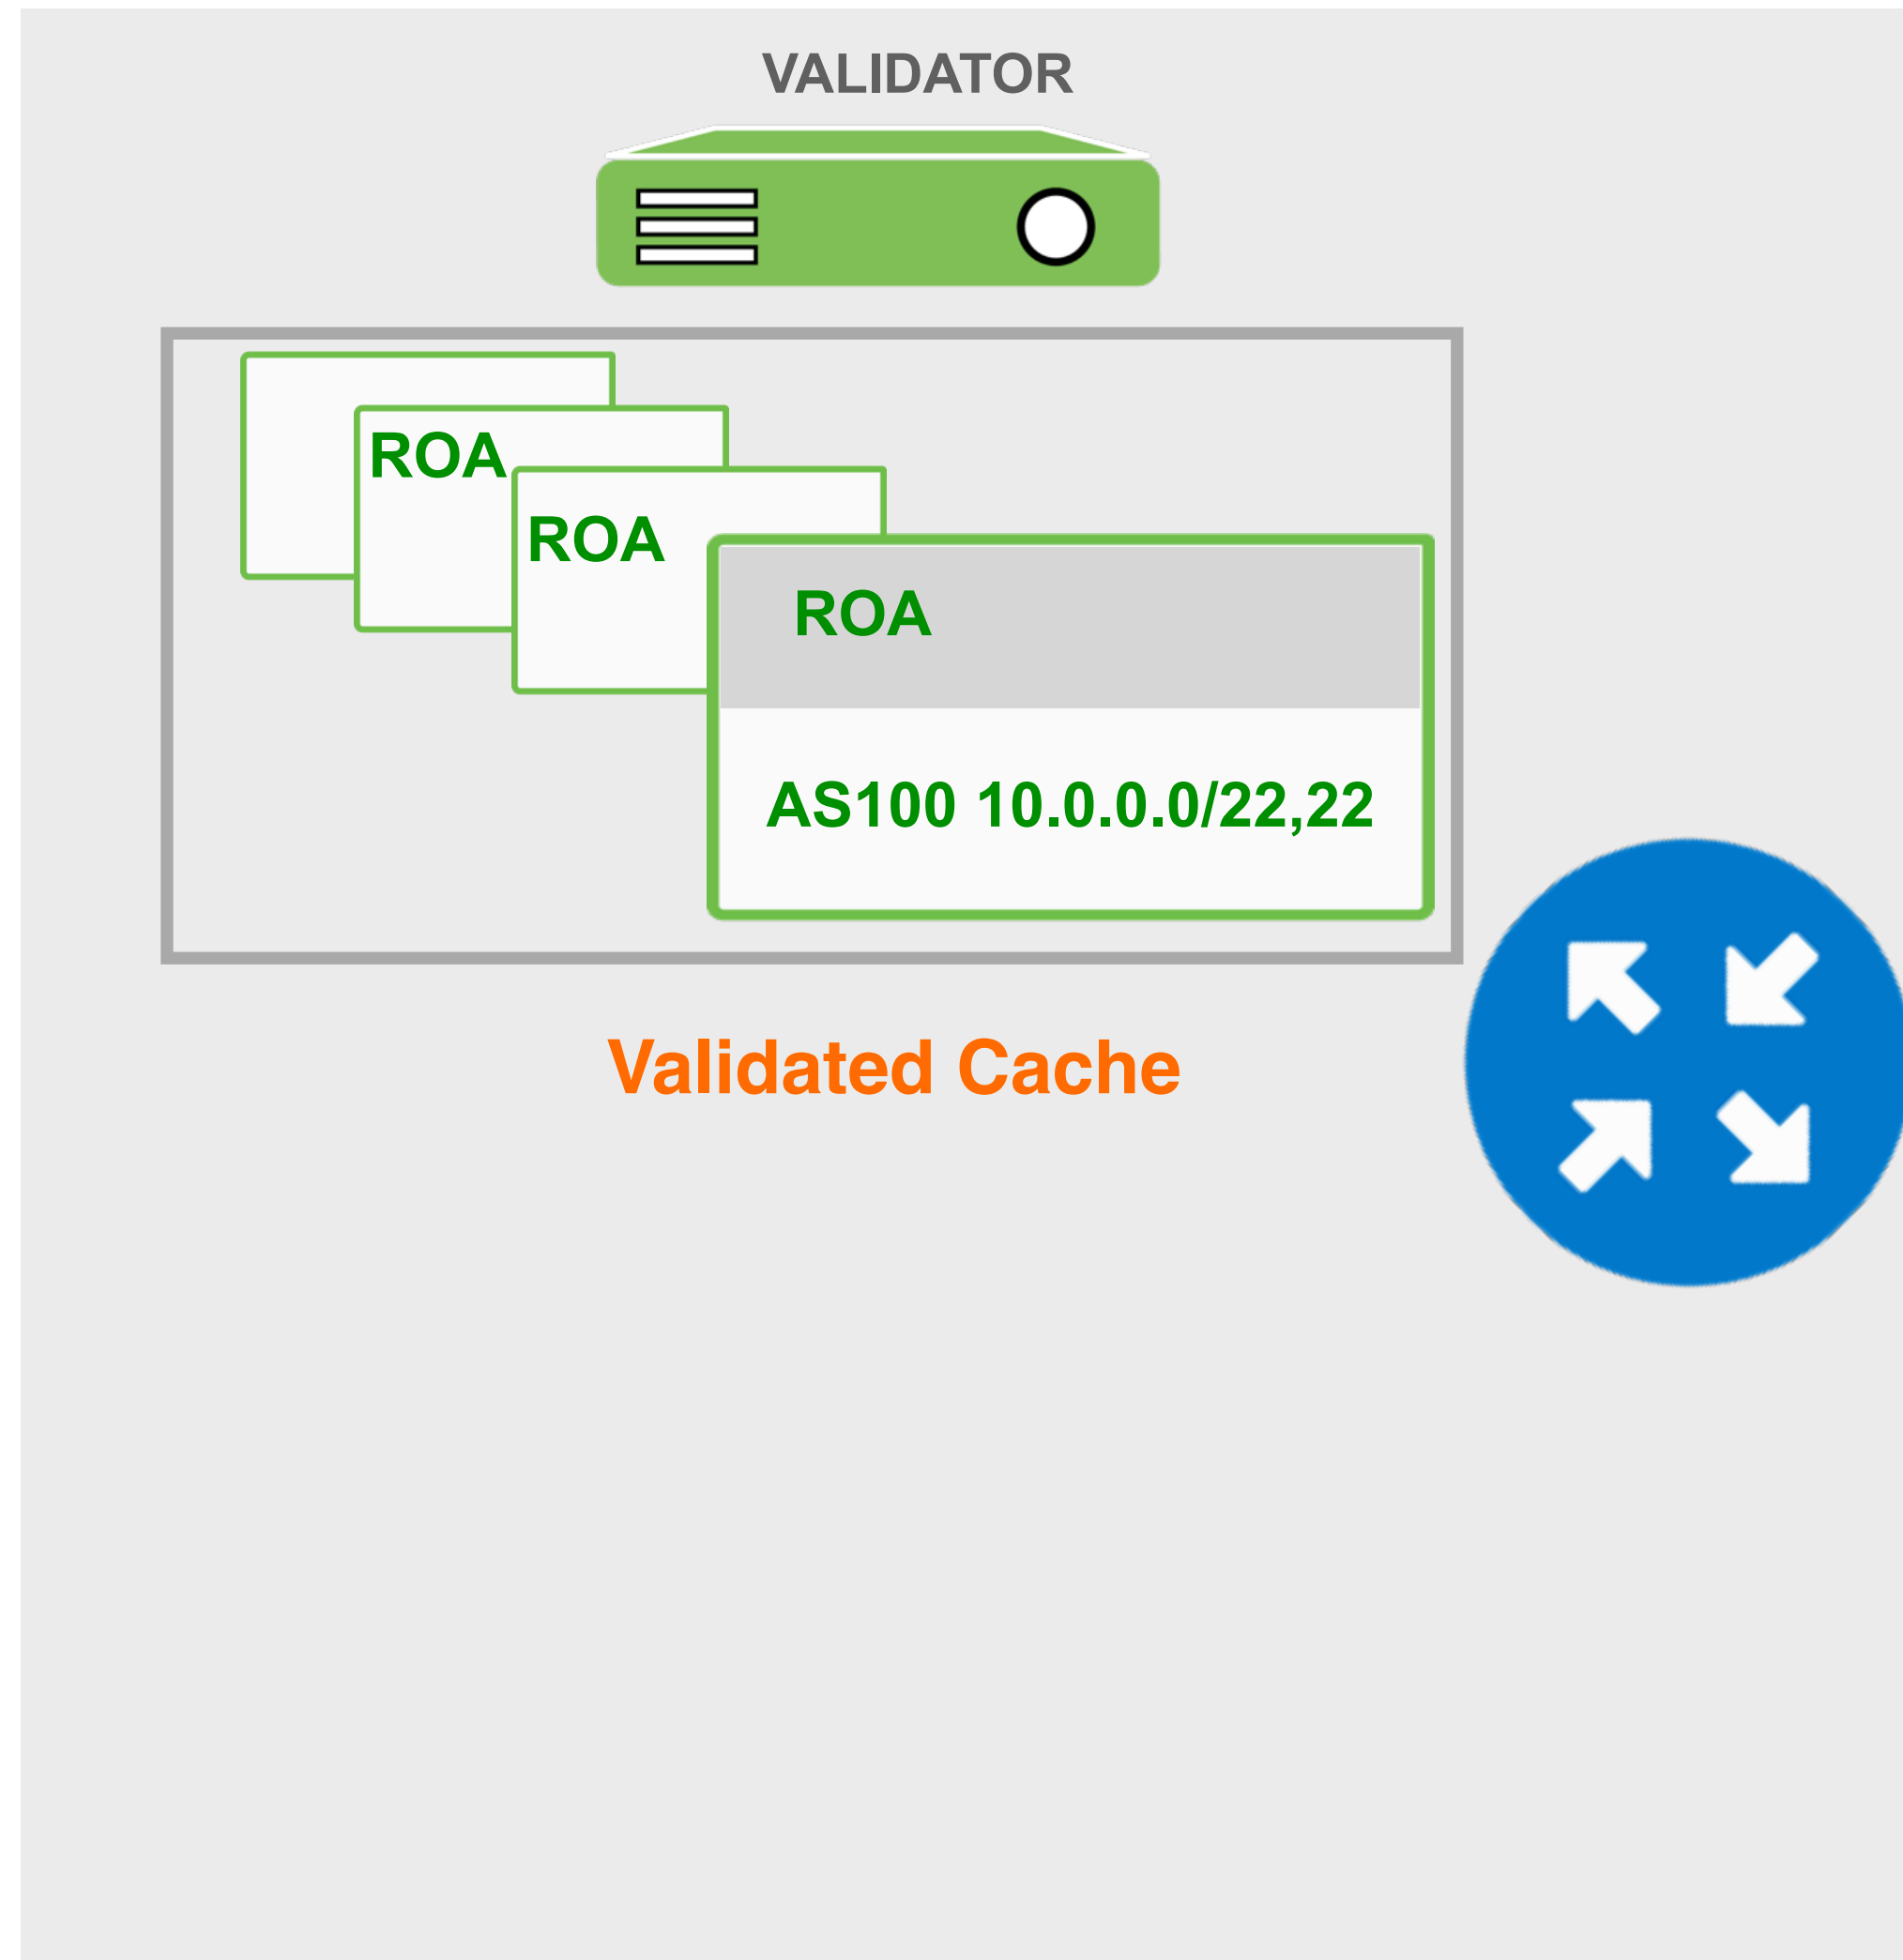

# BGP Valid

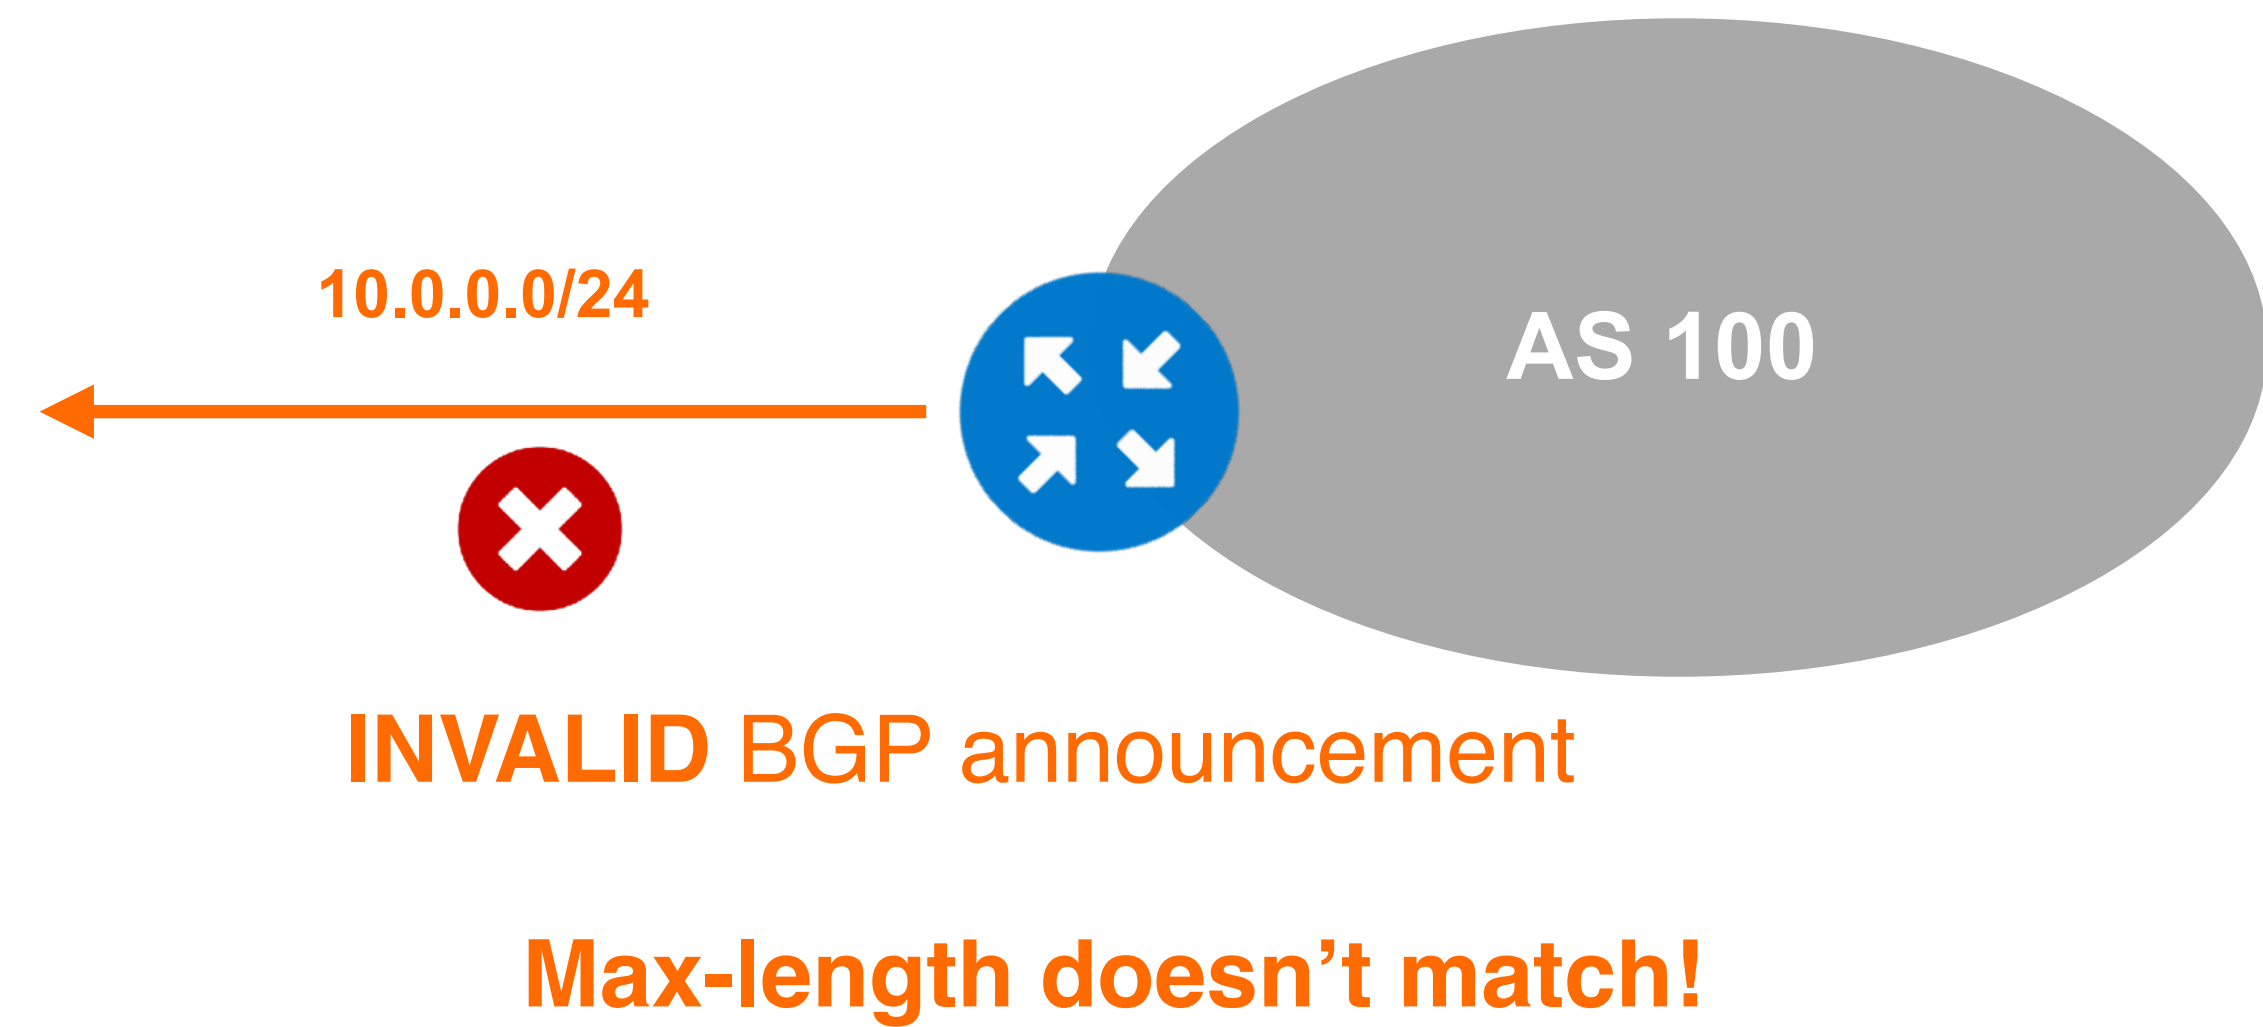

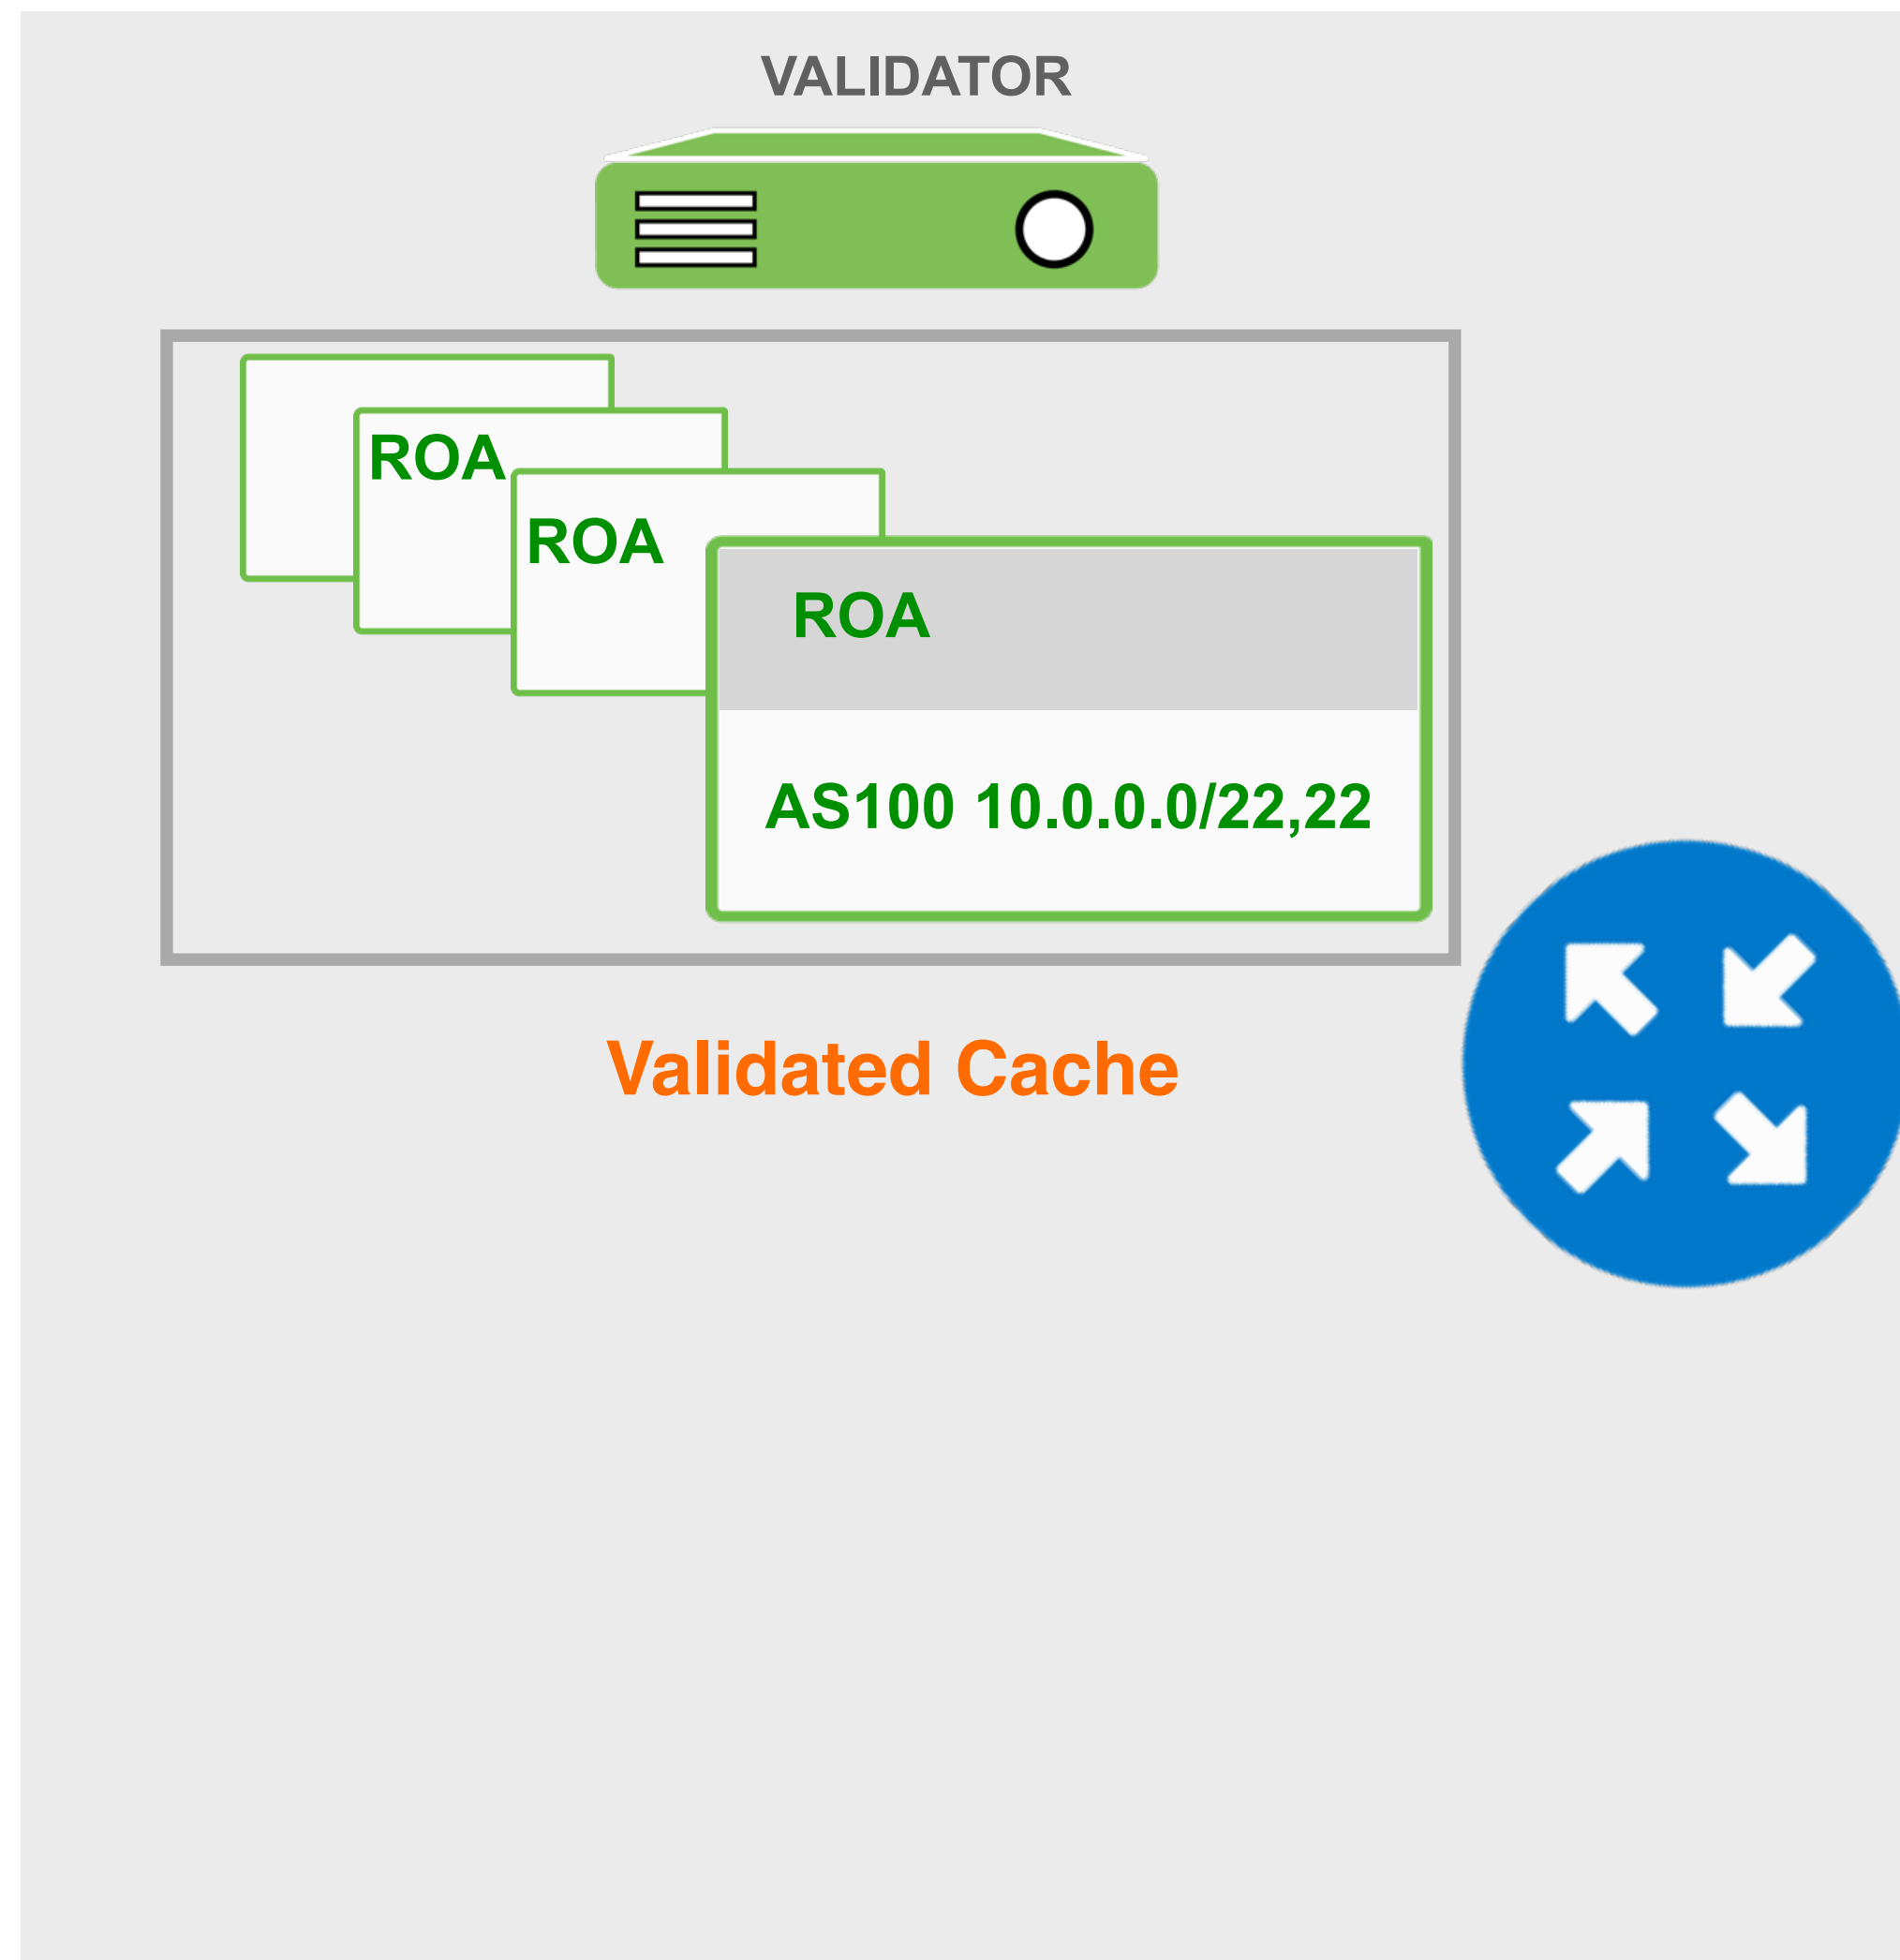

# BGP Invalid

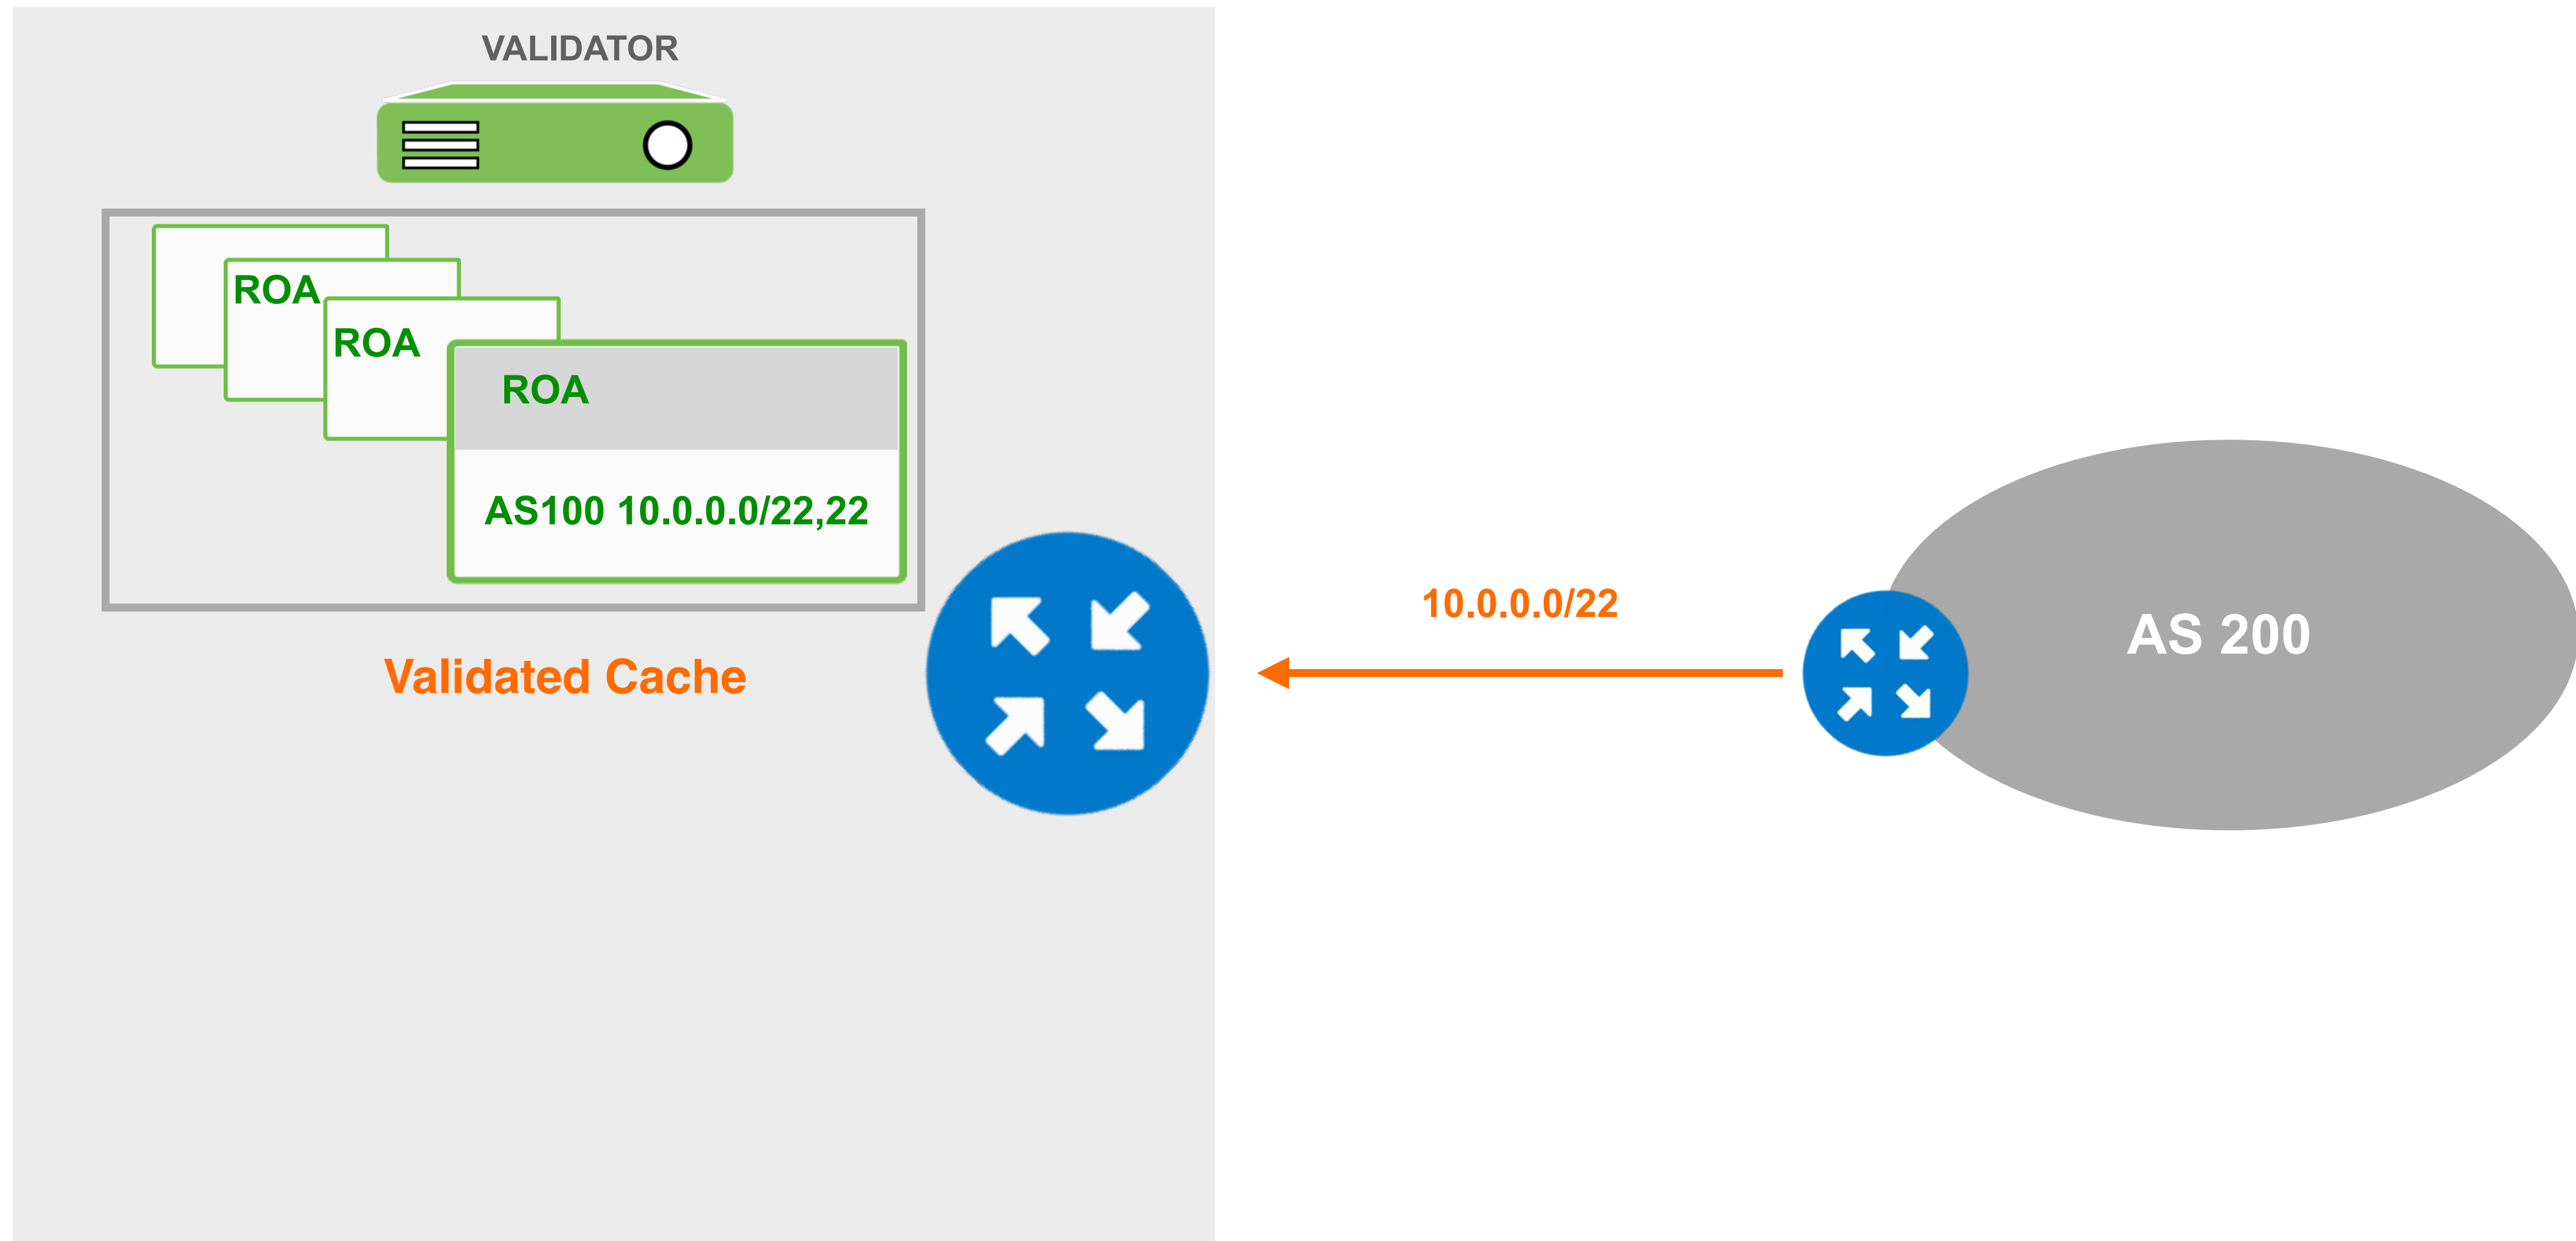

# BGP Invalid

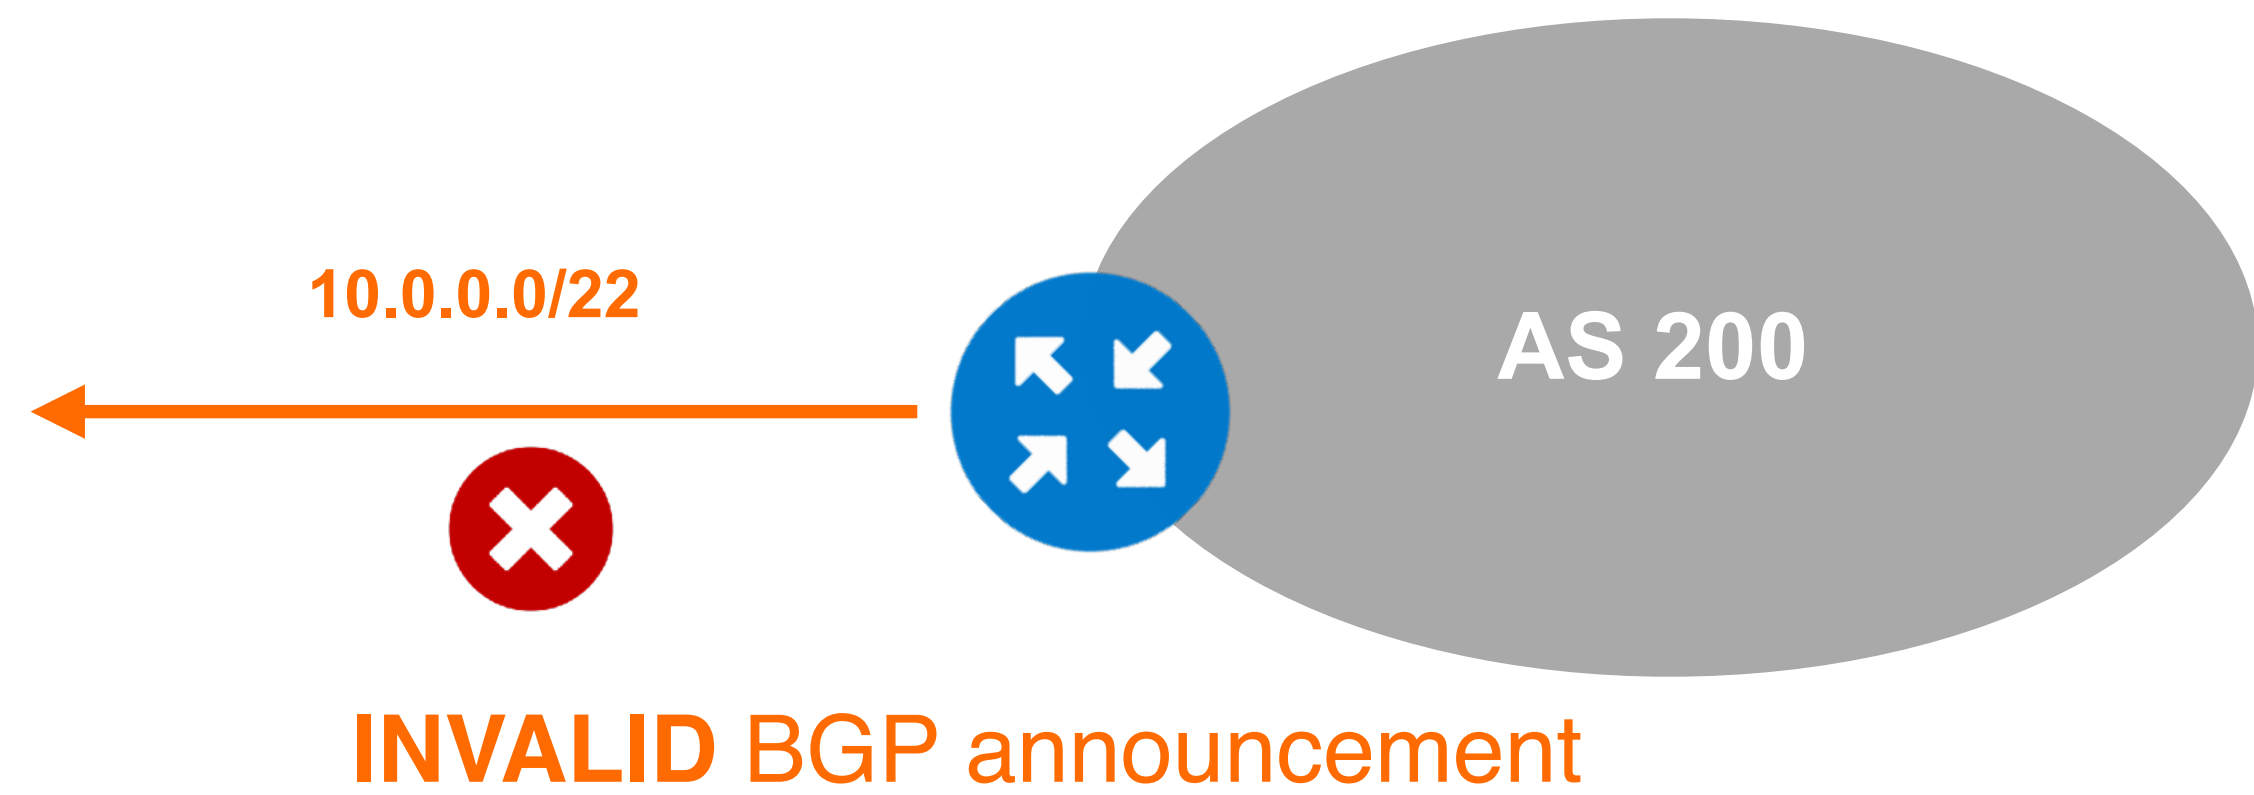

# BGP Invalid

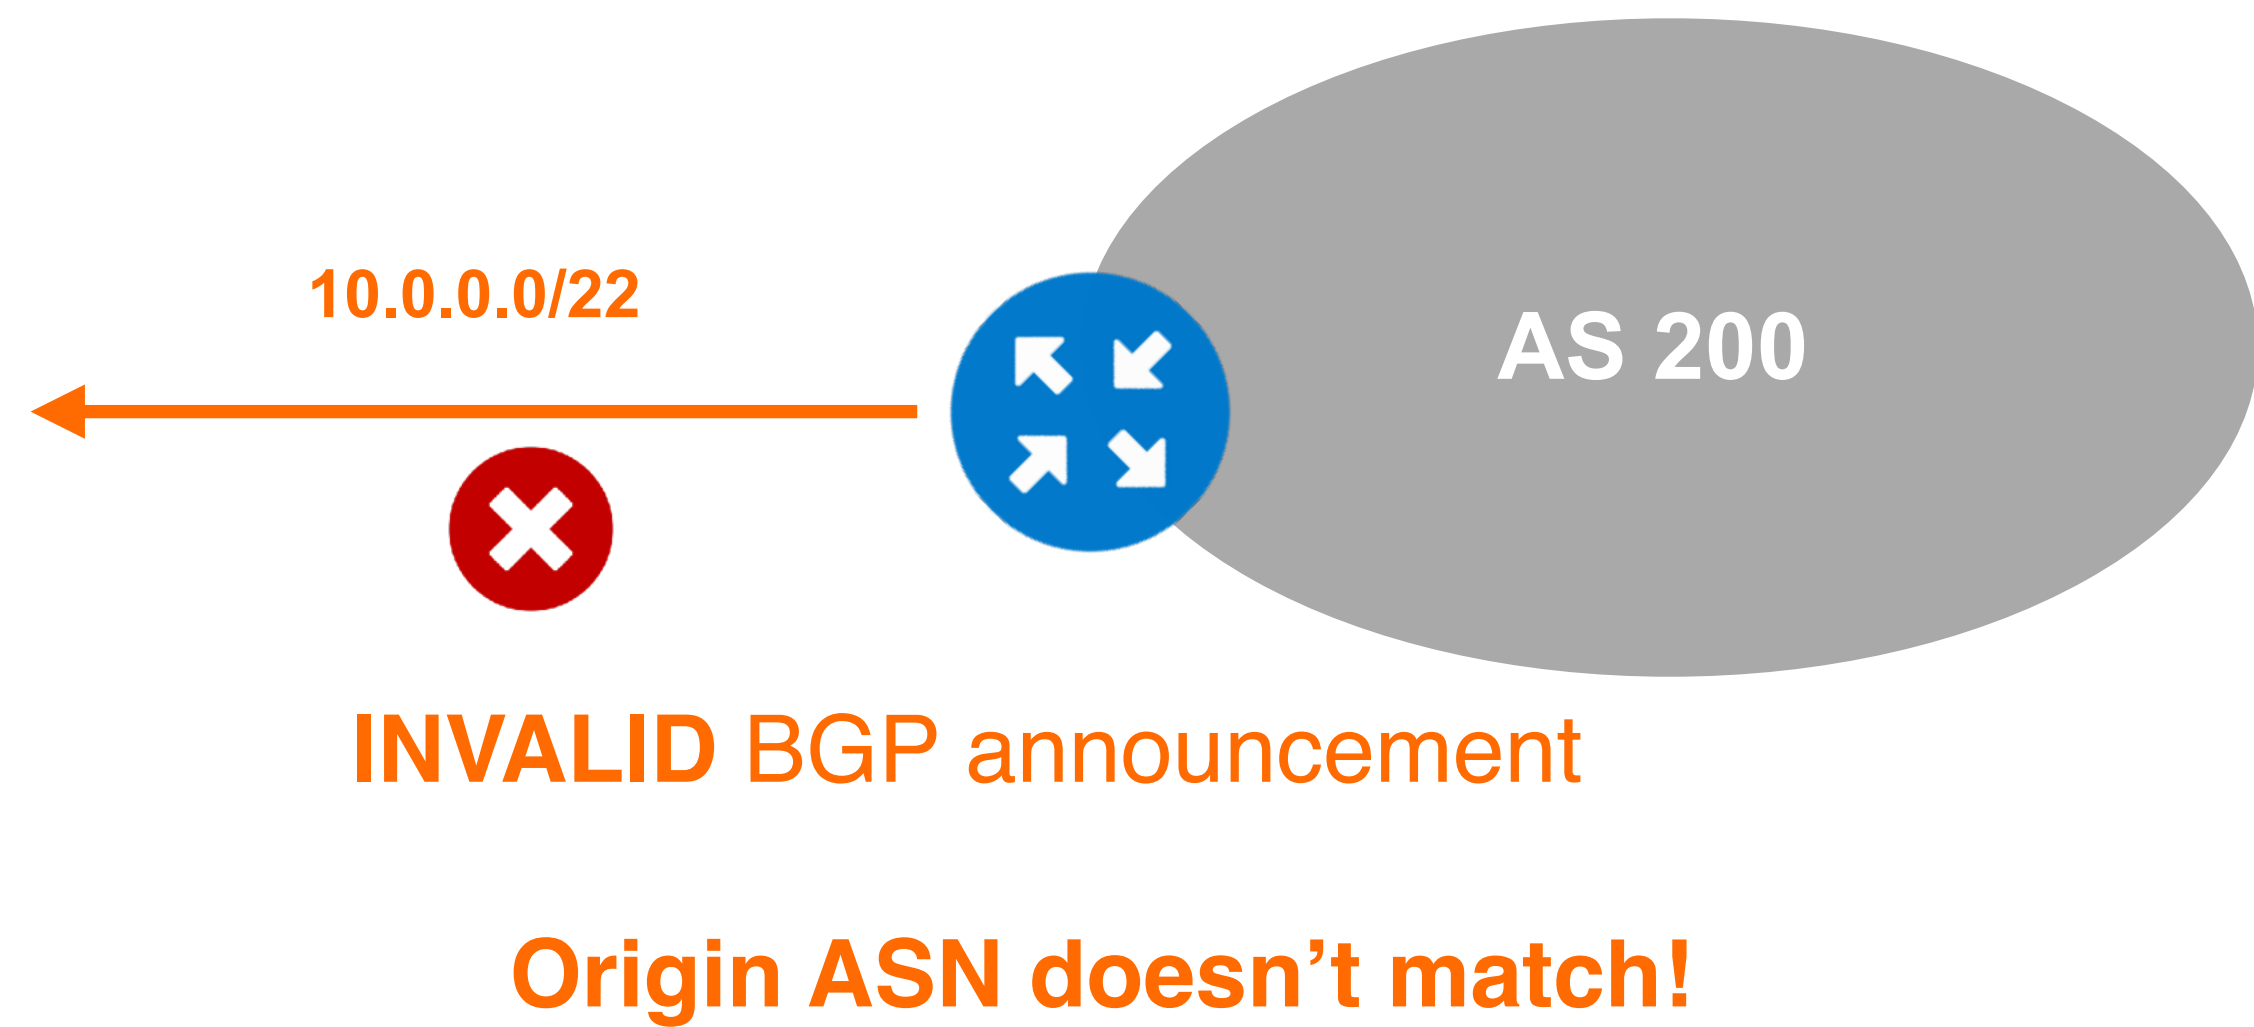

# BGP Invalid

# BGP Invalid

# BGP Invalid

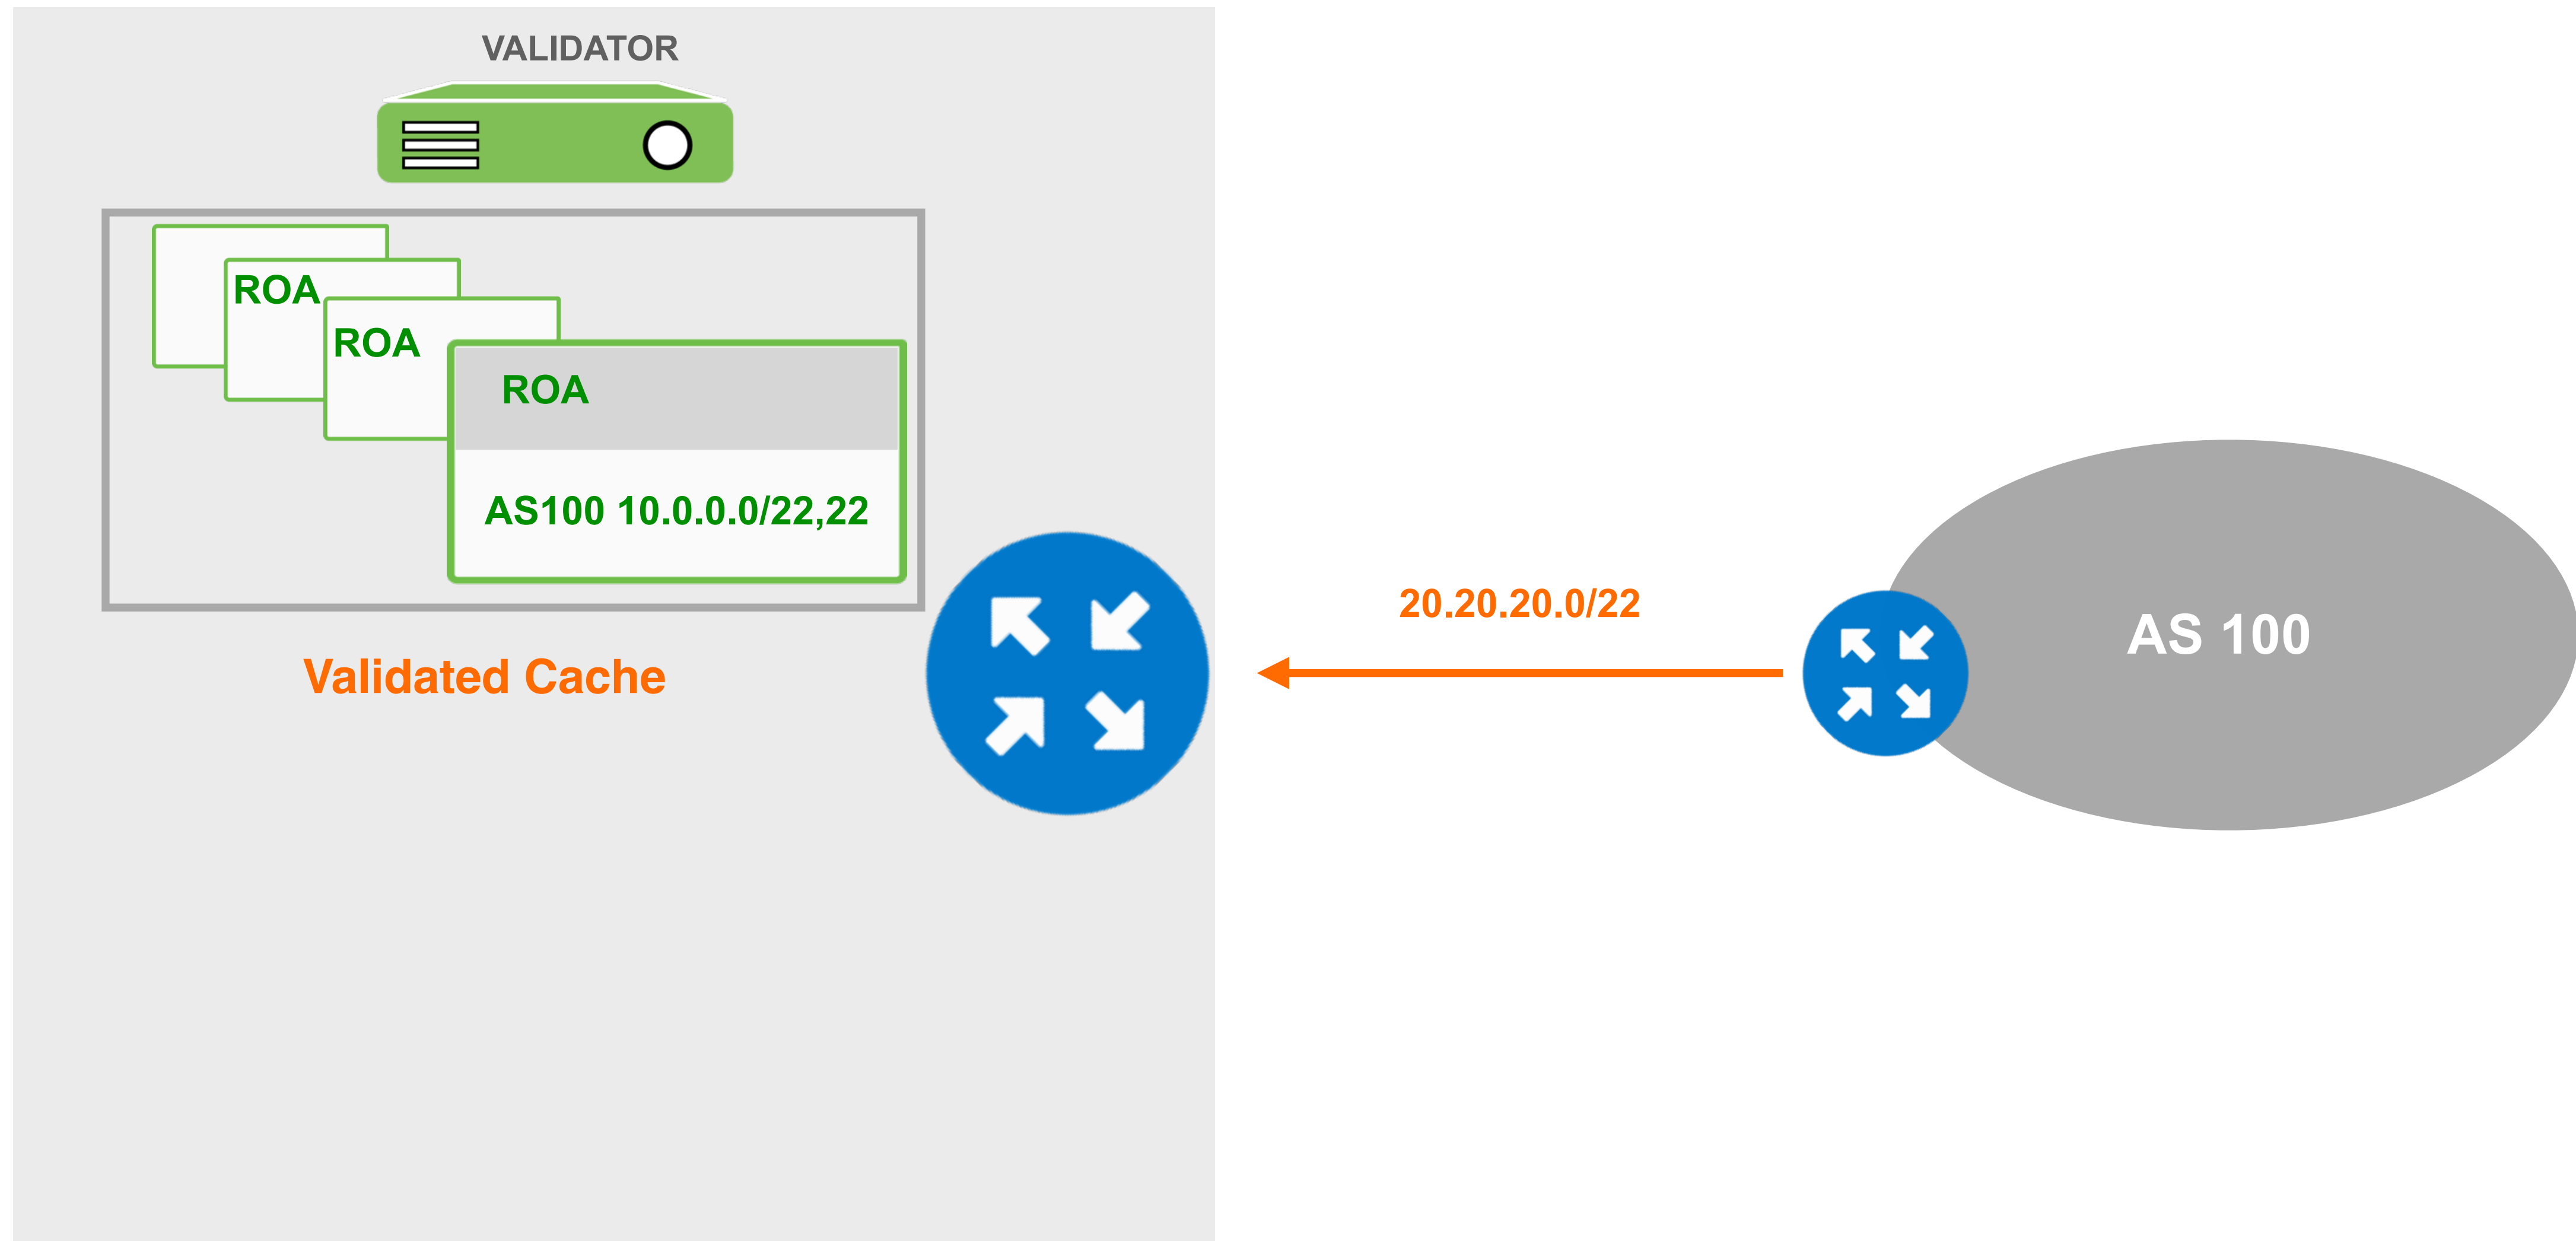

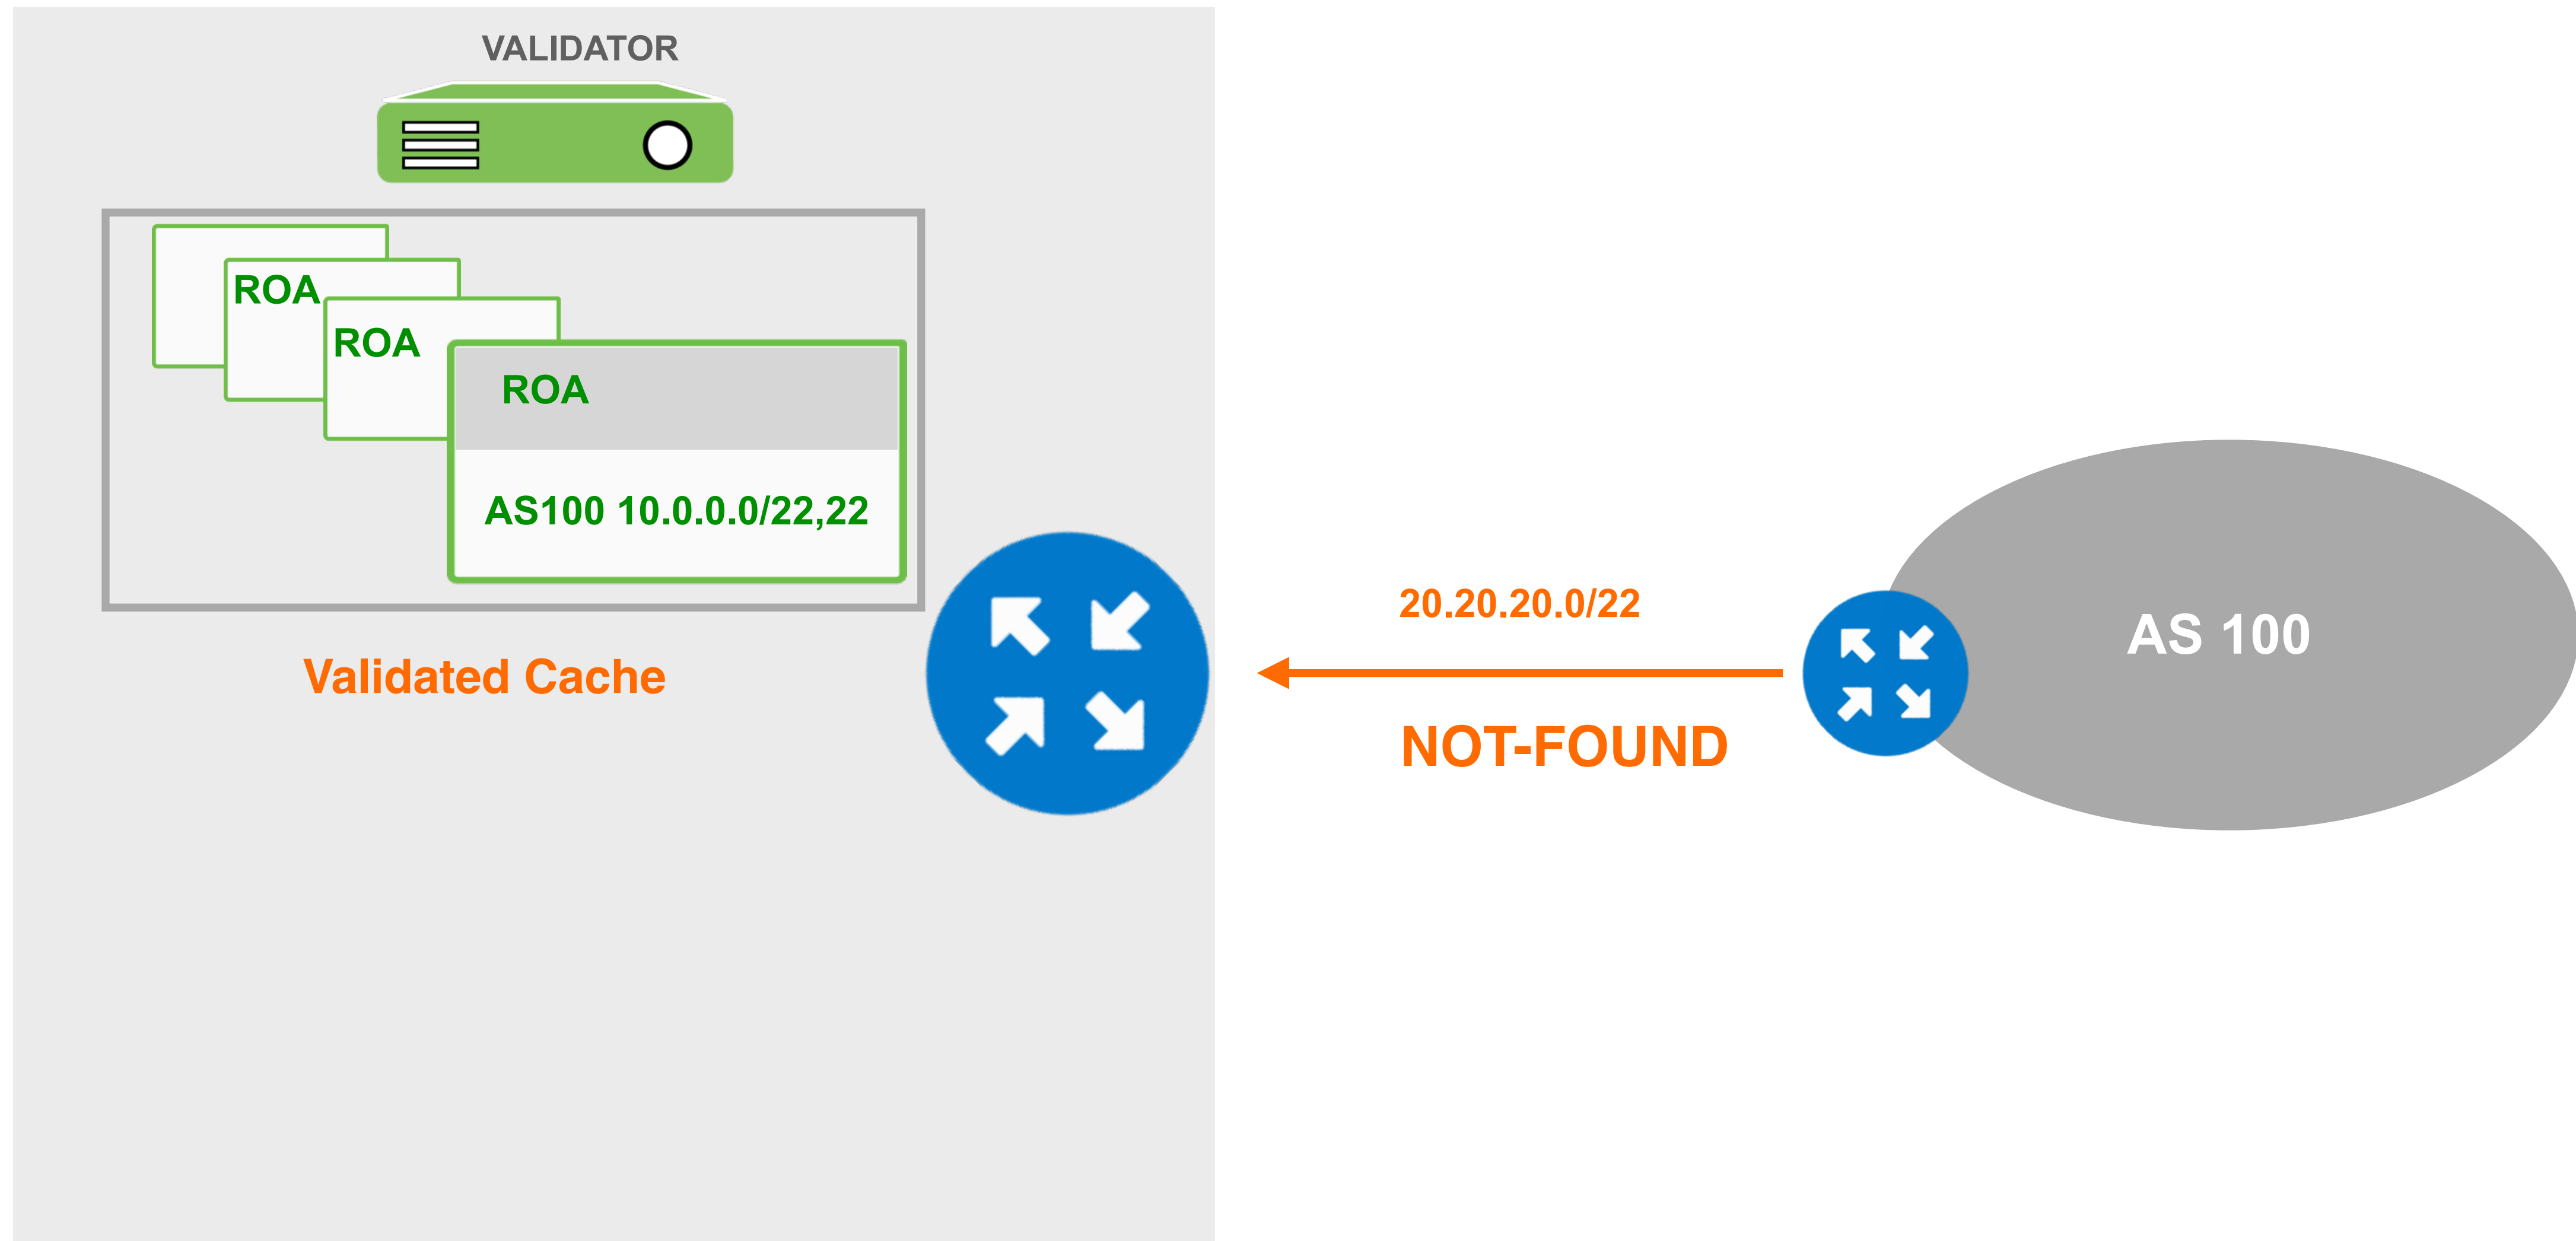

So, RPKI does two checks to validate BGP announcements:

**Max-length and Origin ASN**

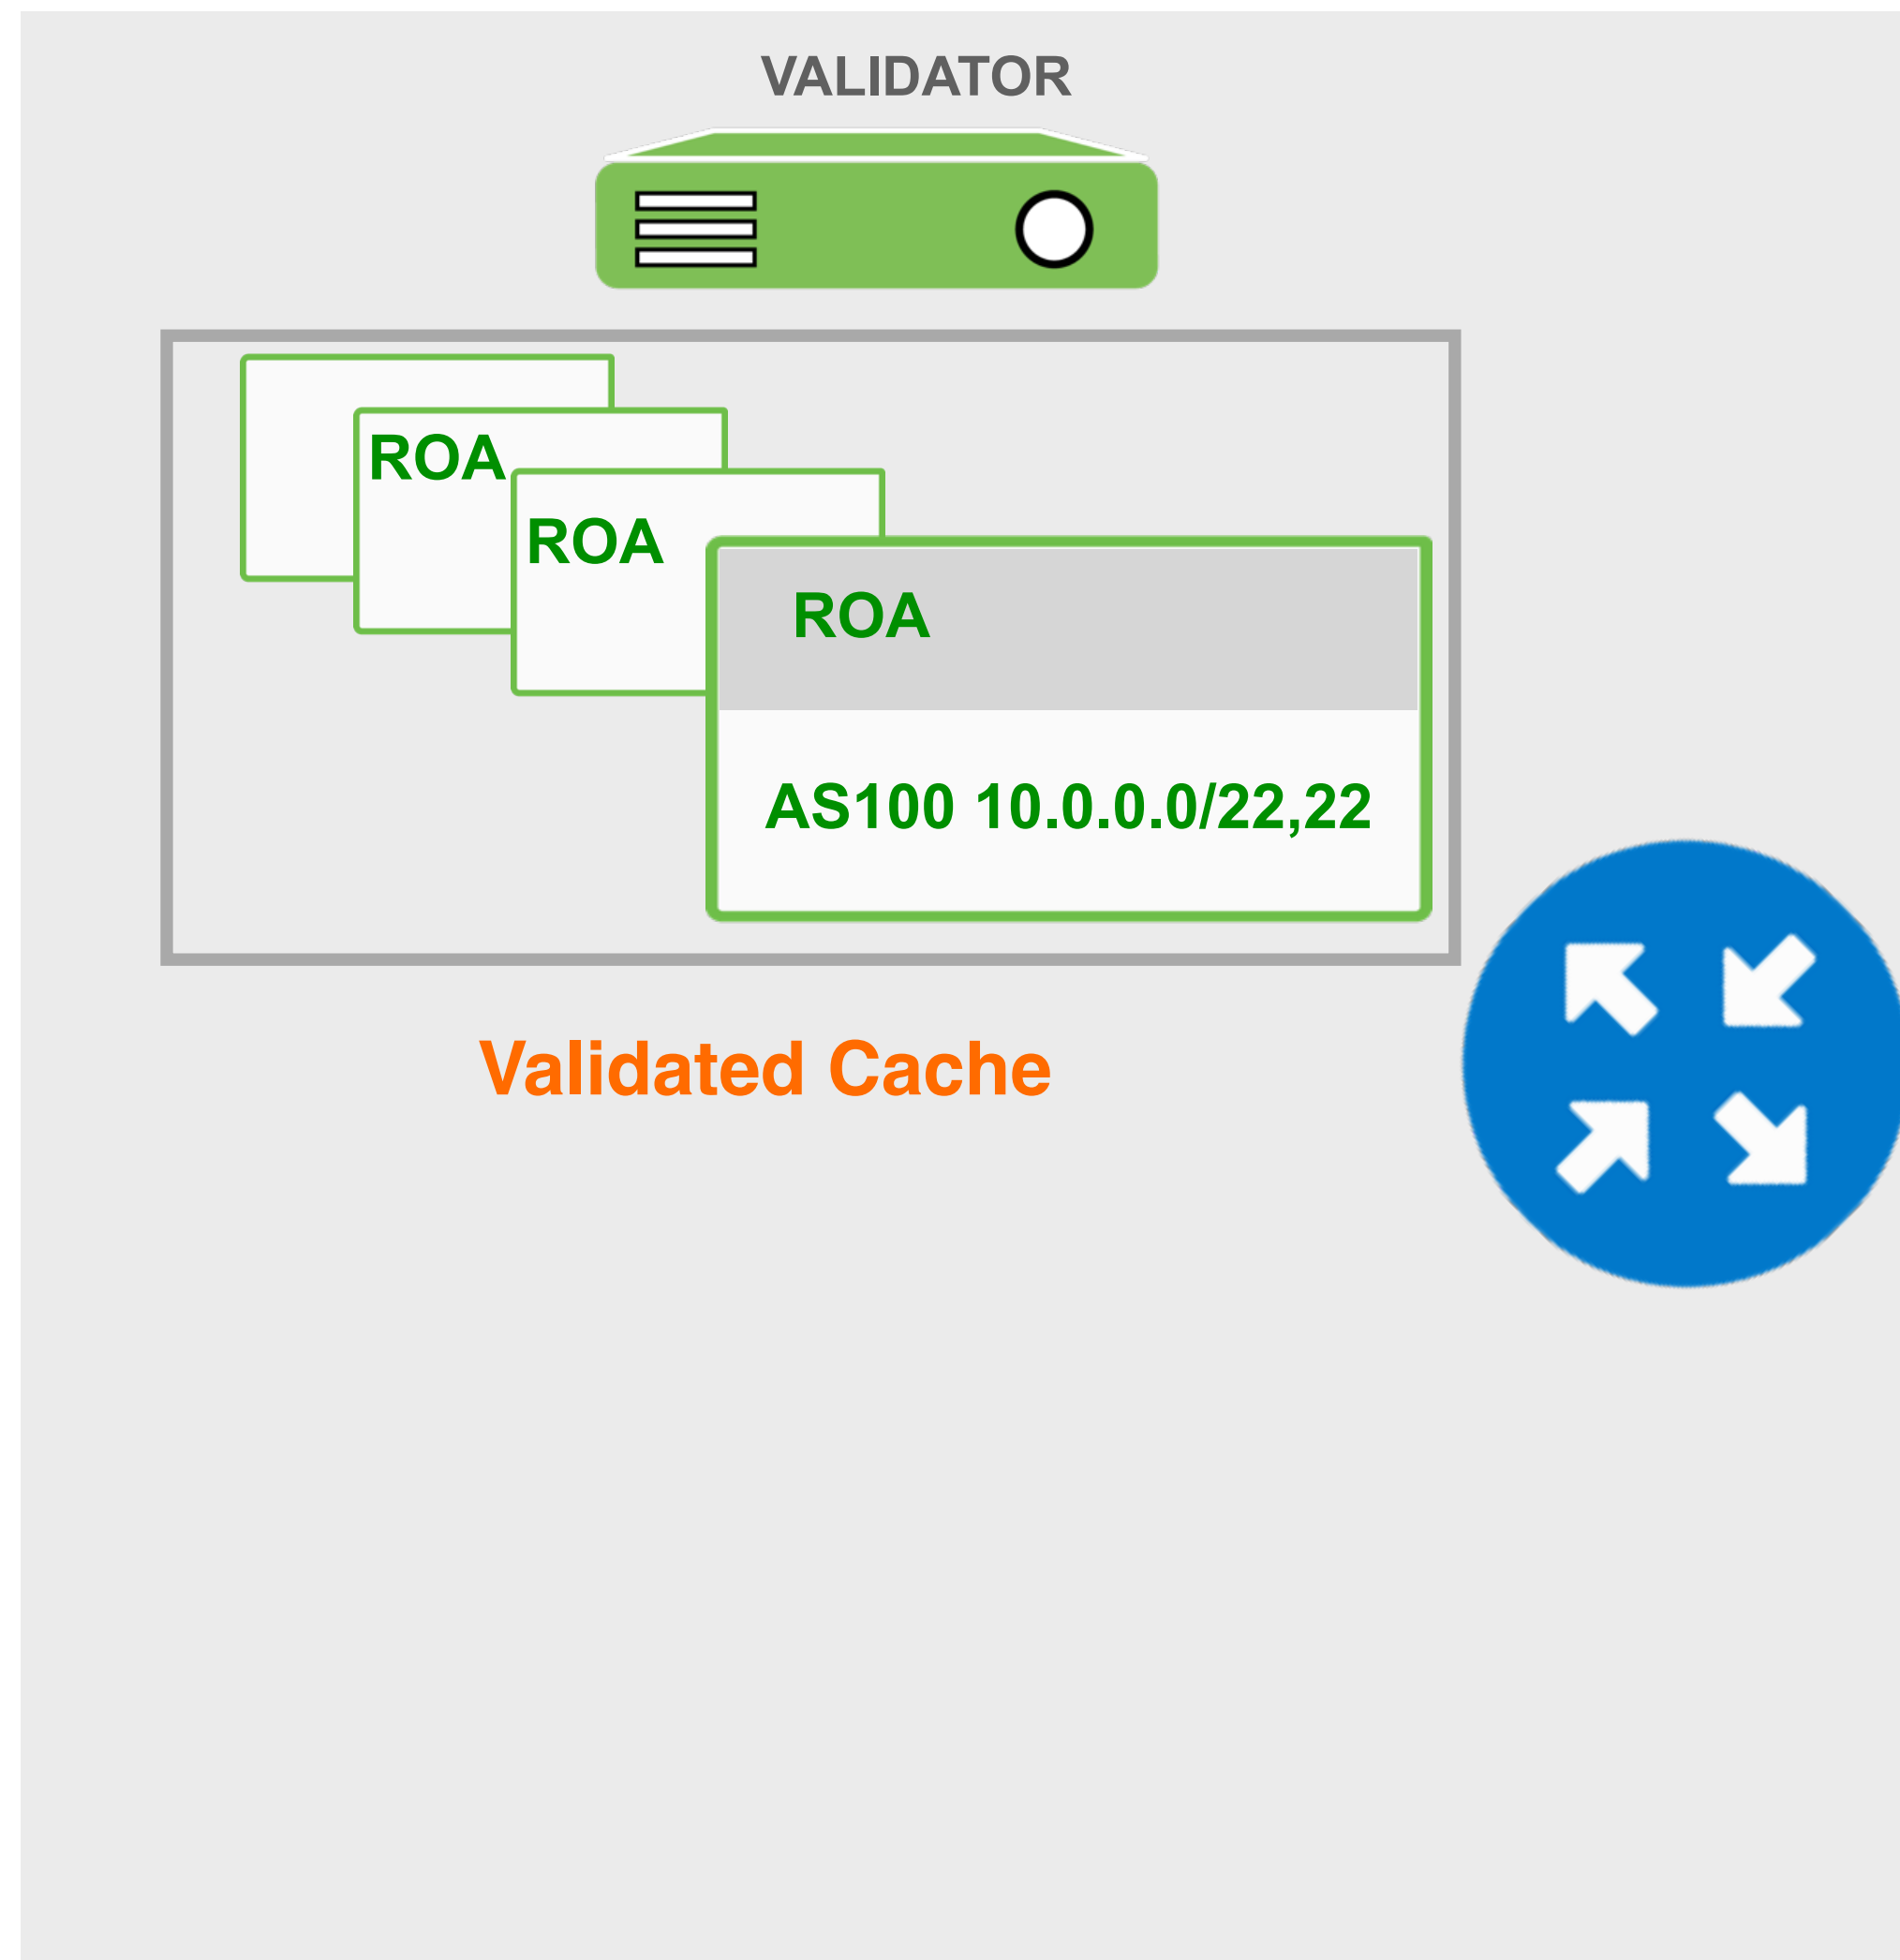

# BGP Not-Found

# BGP Not-Found

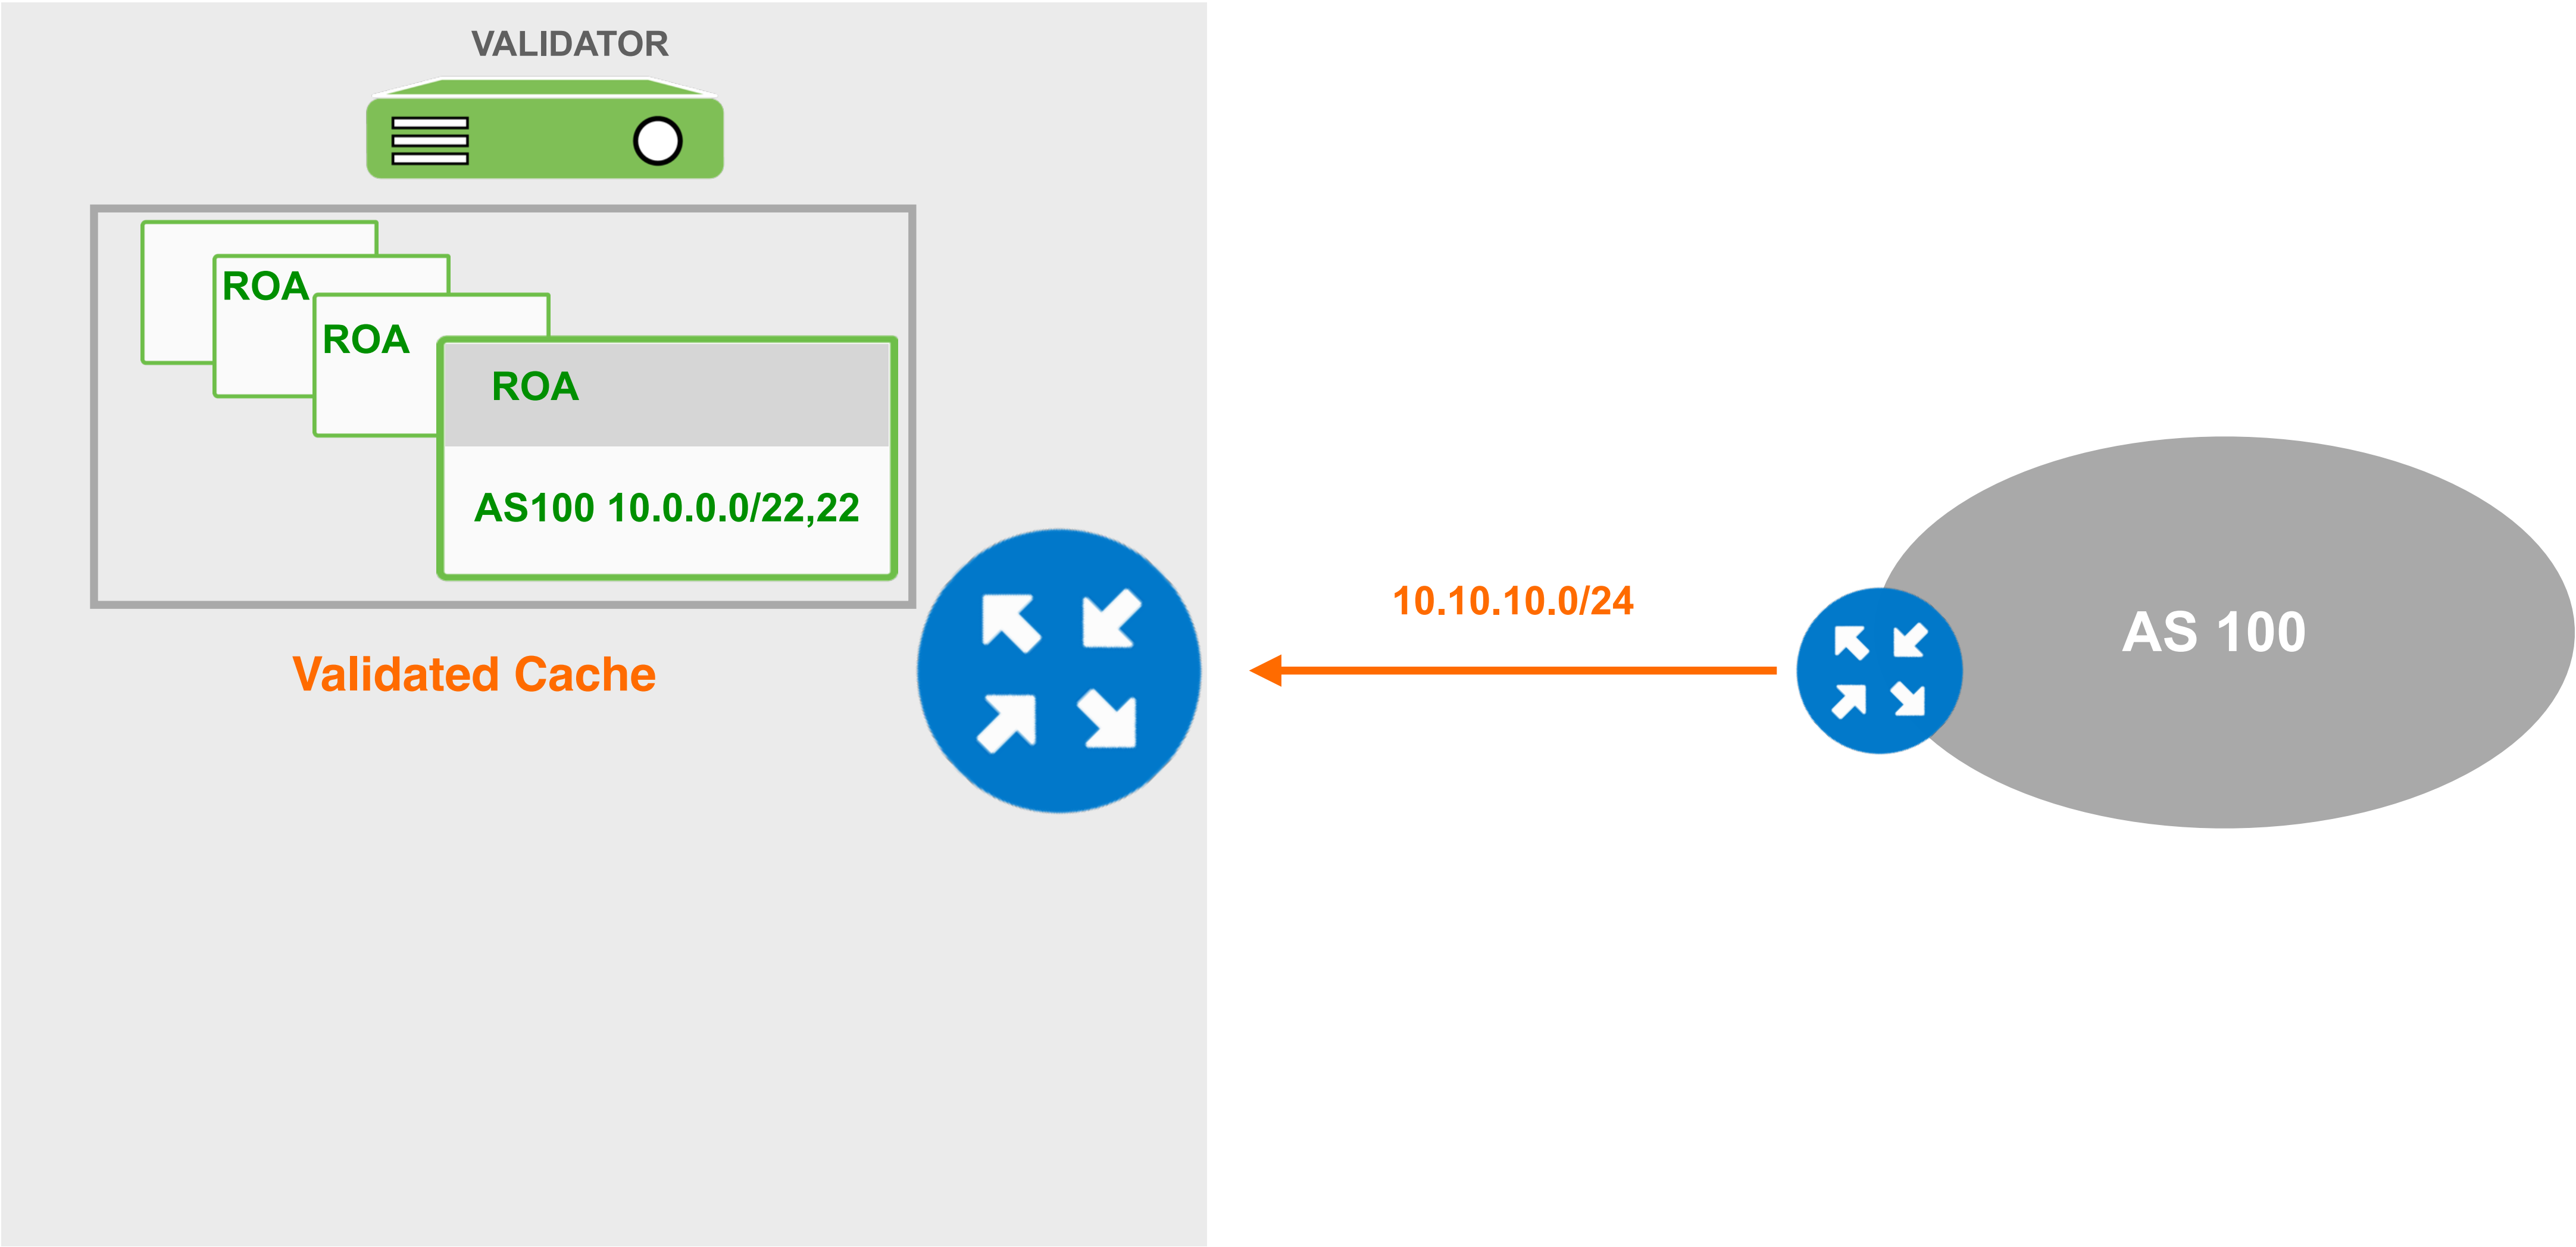

# BGP Not-Found

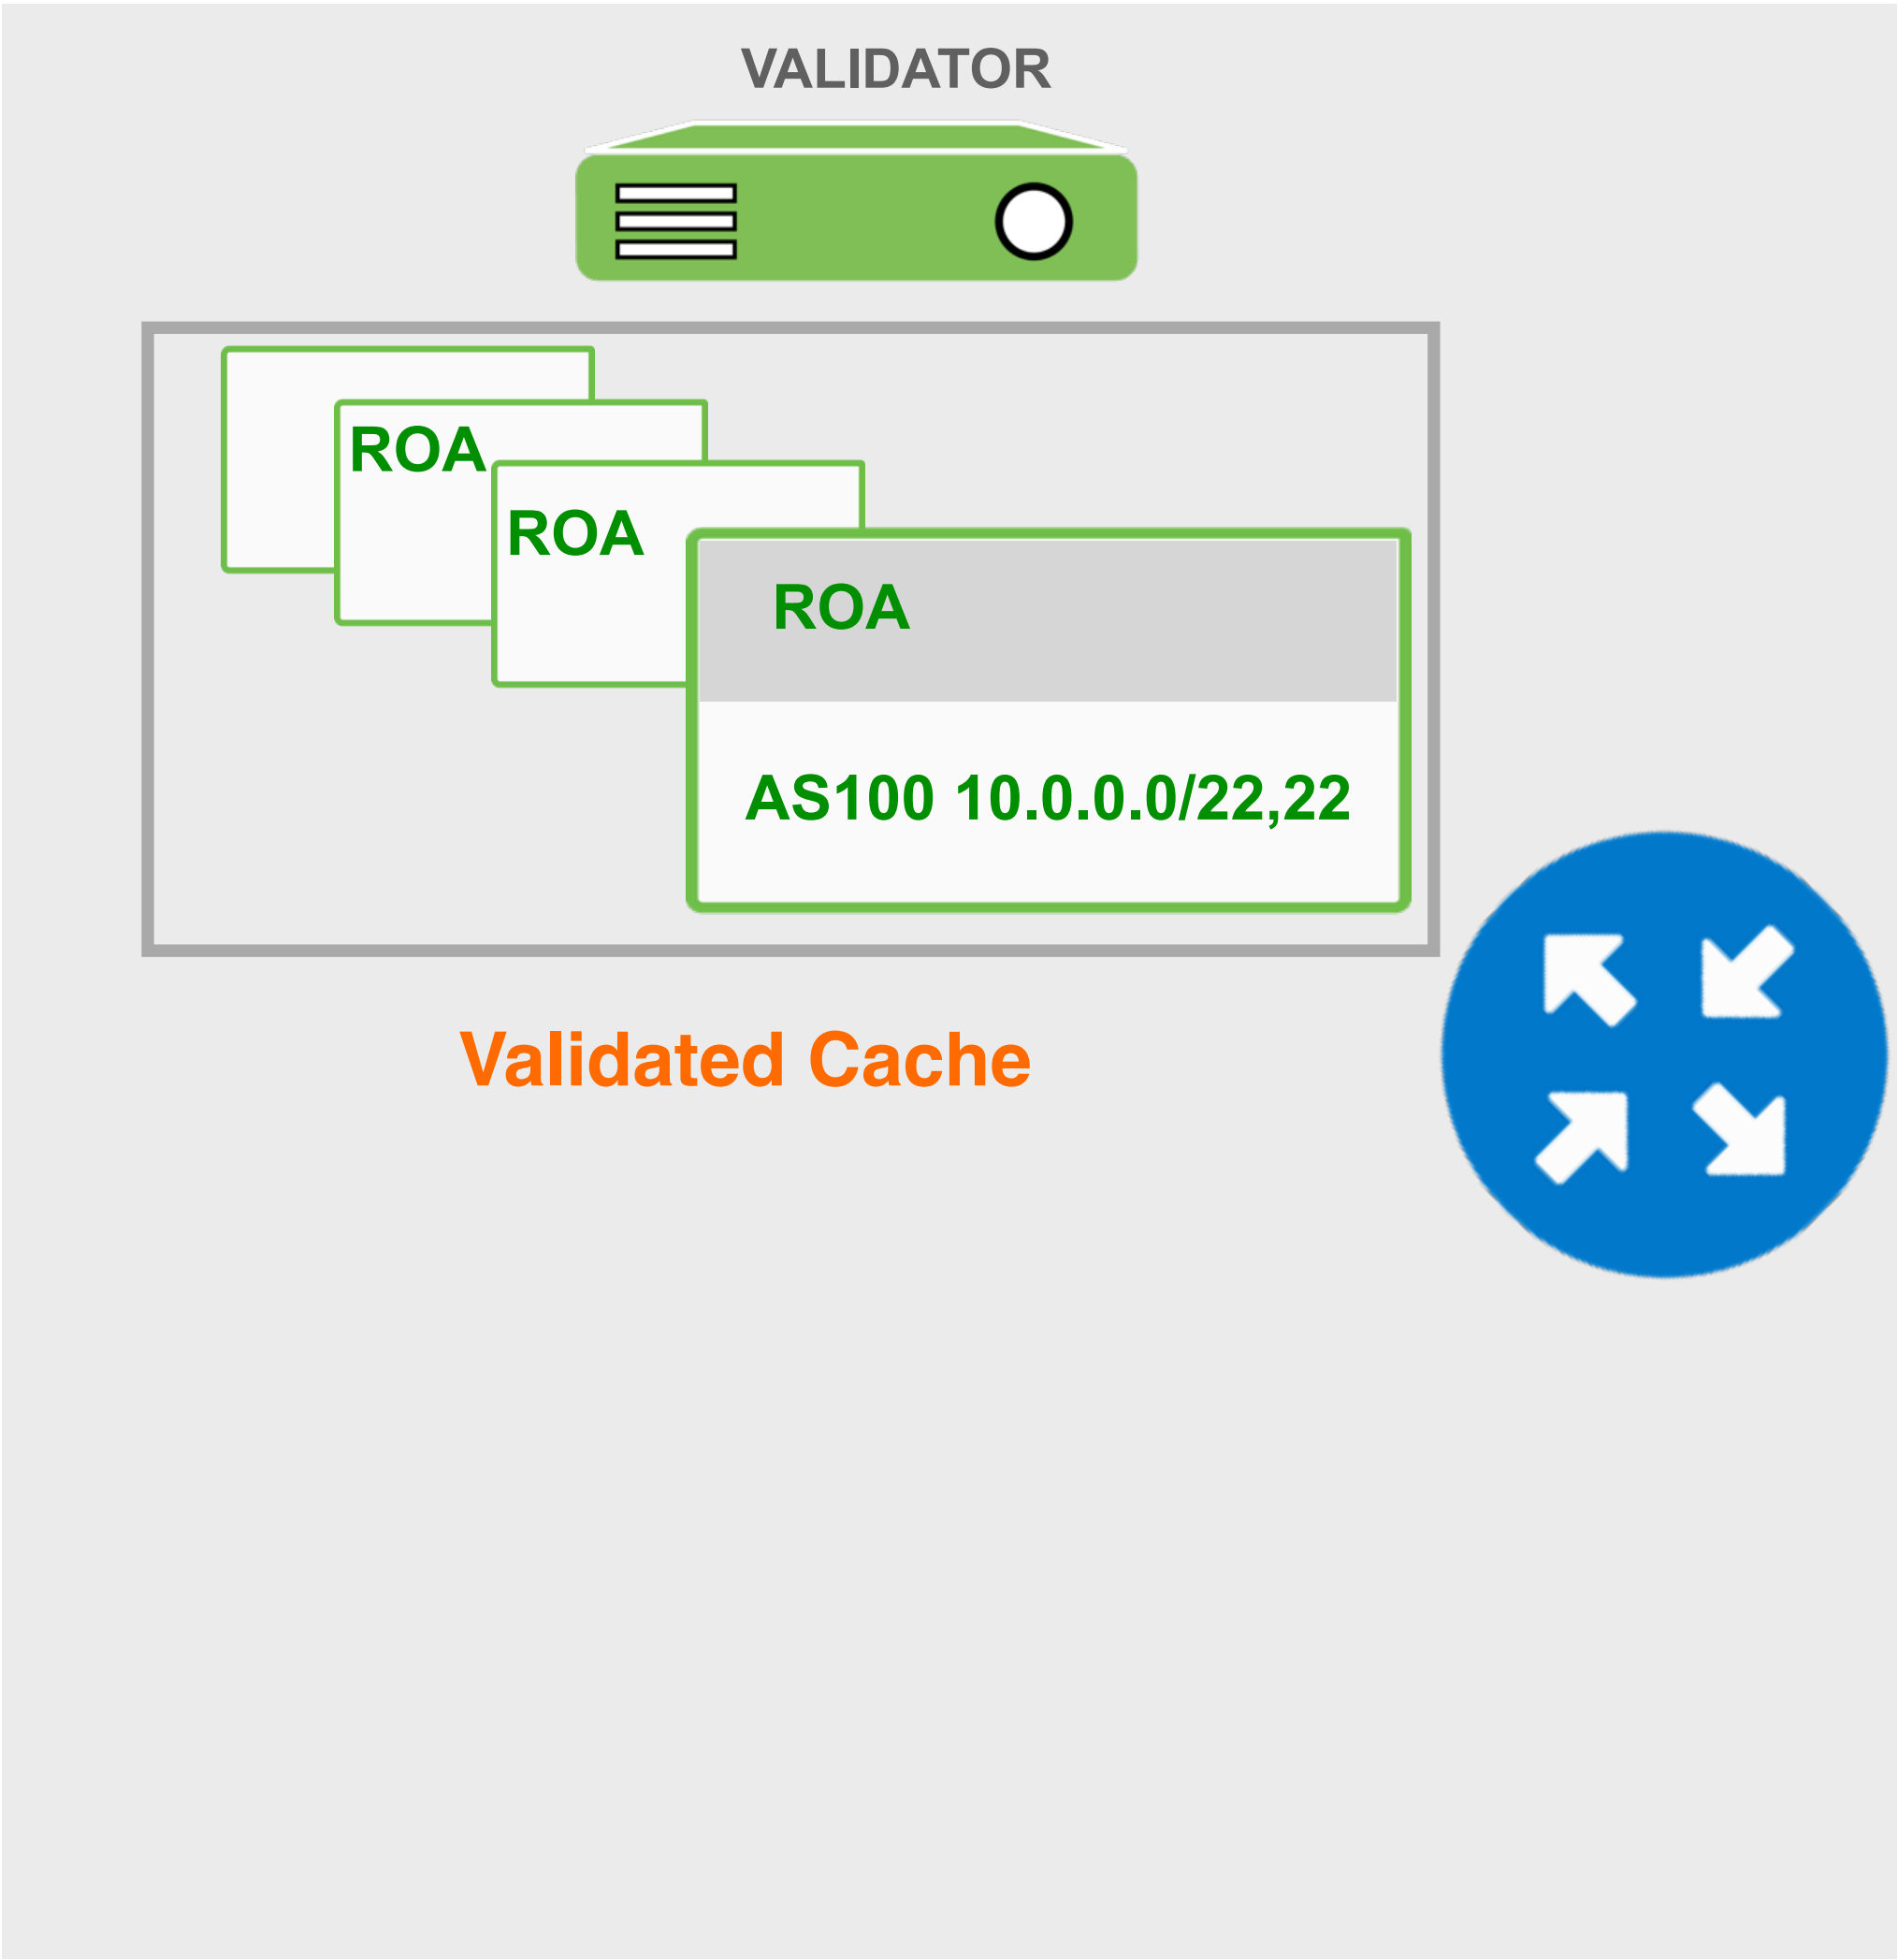

There is no ROA for this BGP prefix!

# Whitelisting

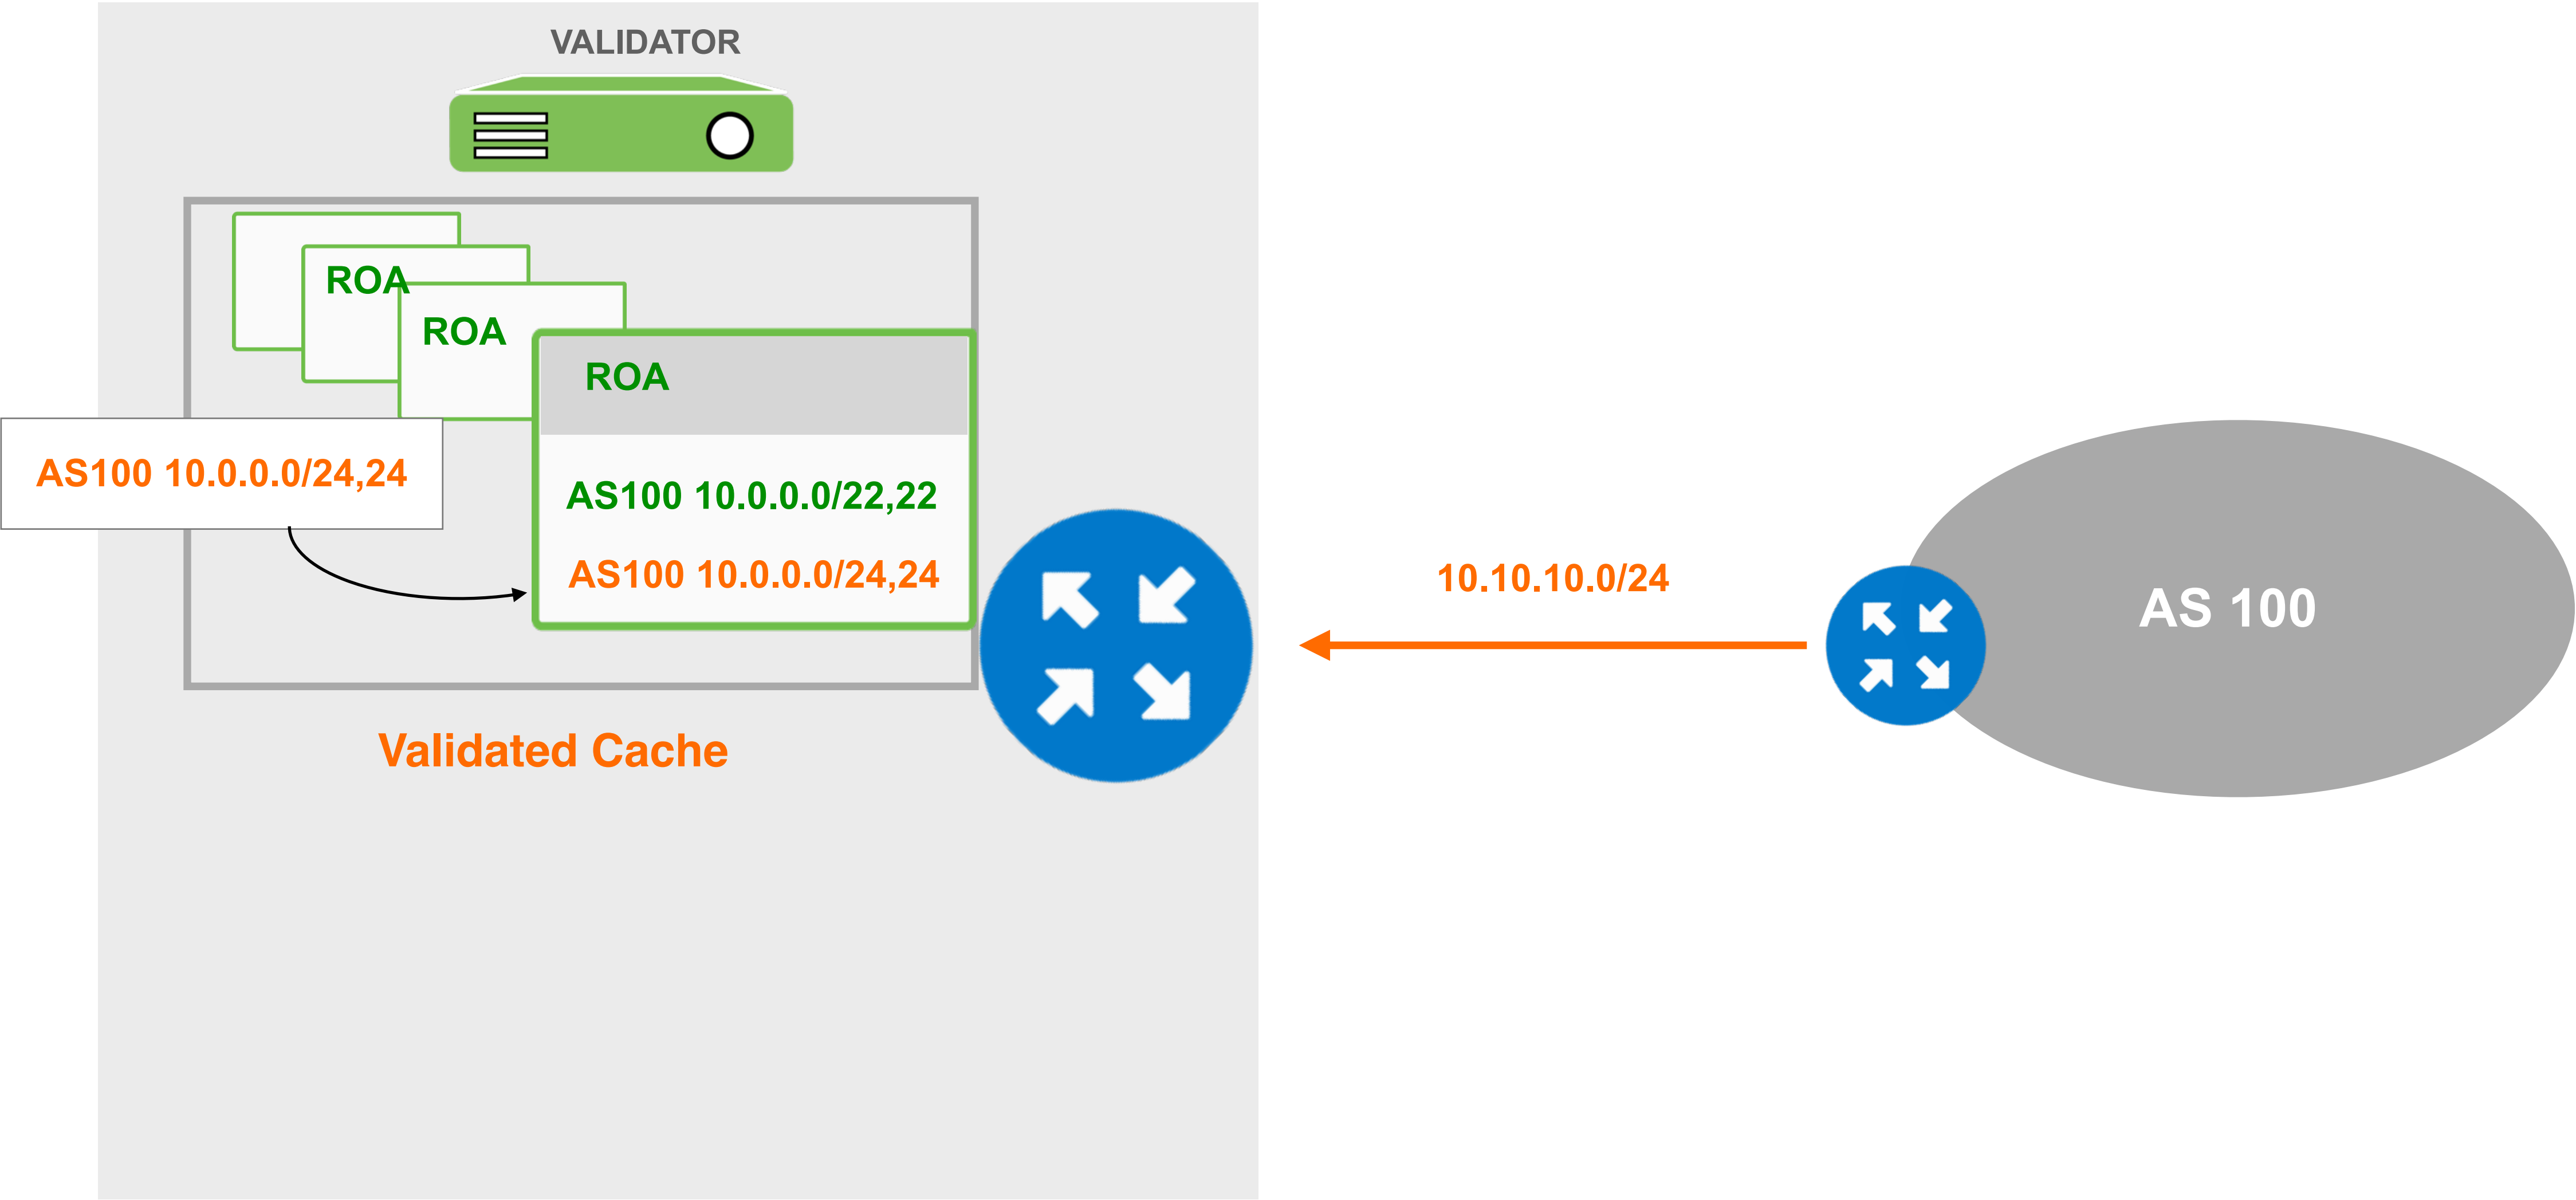

# Whitelisting

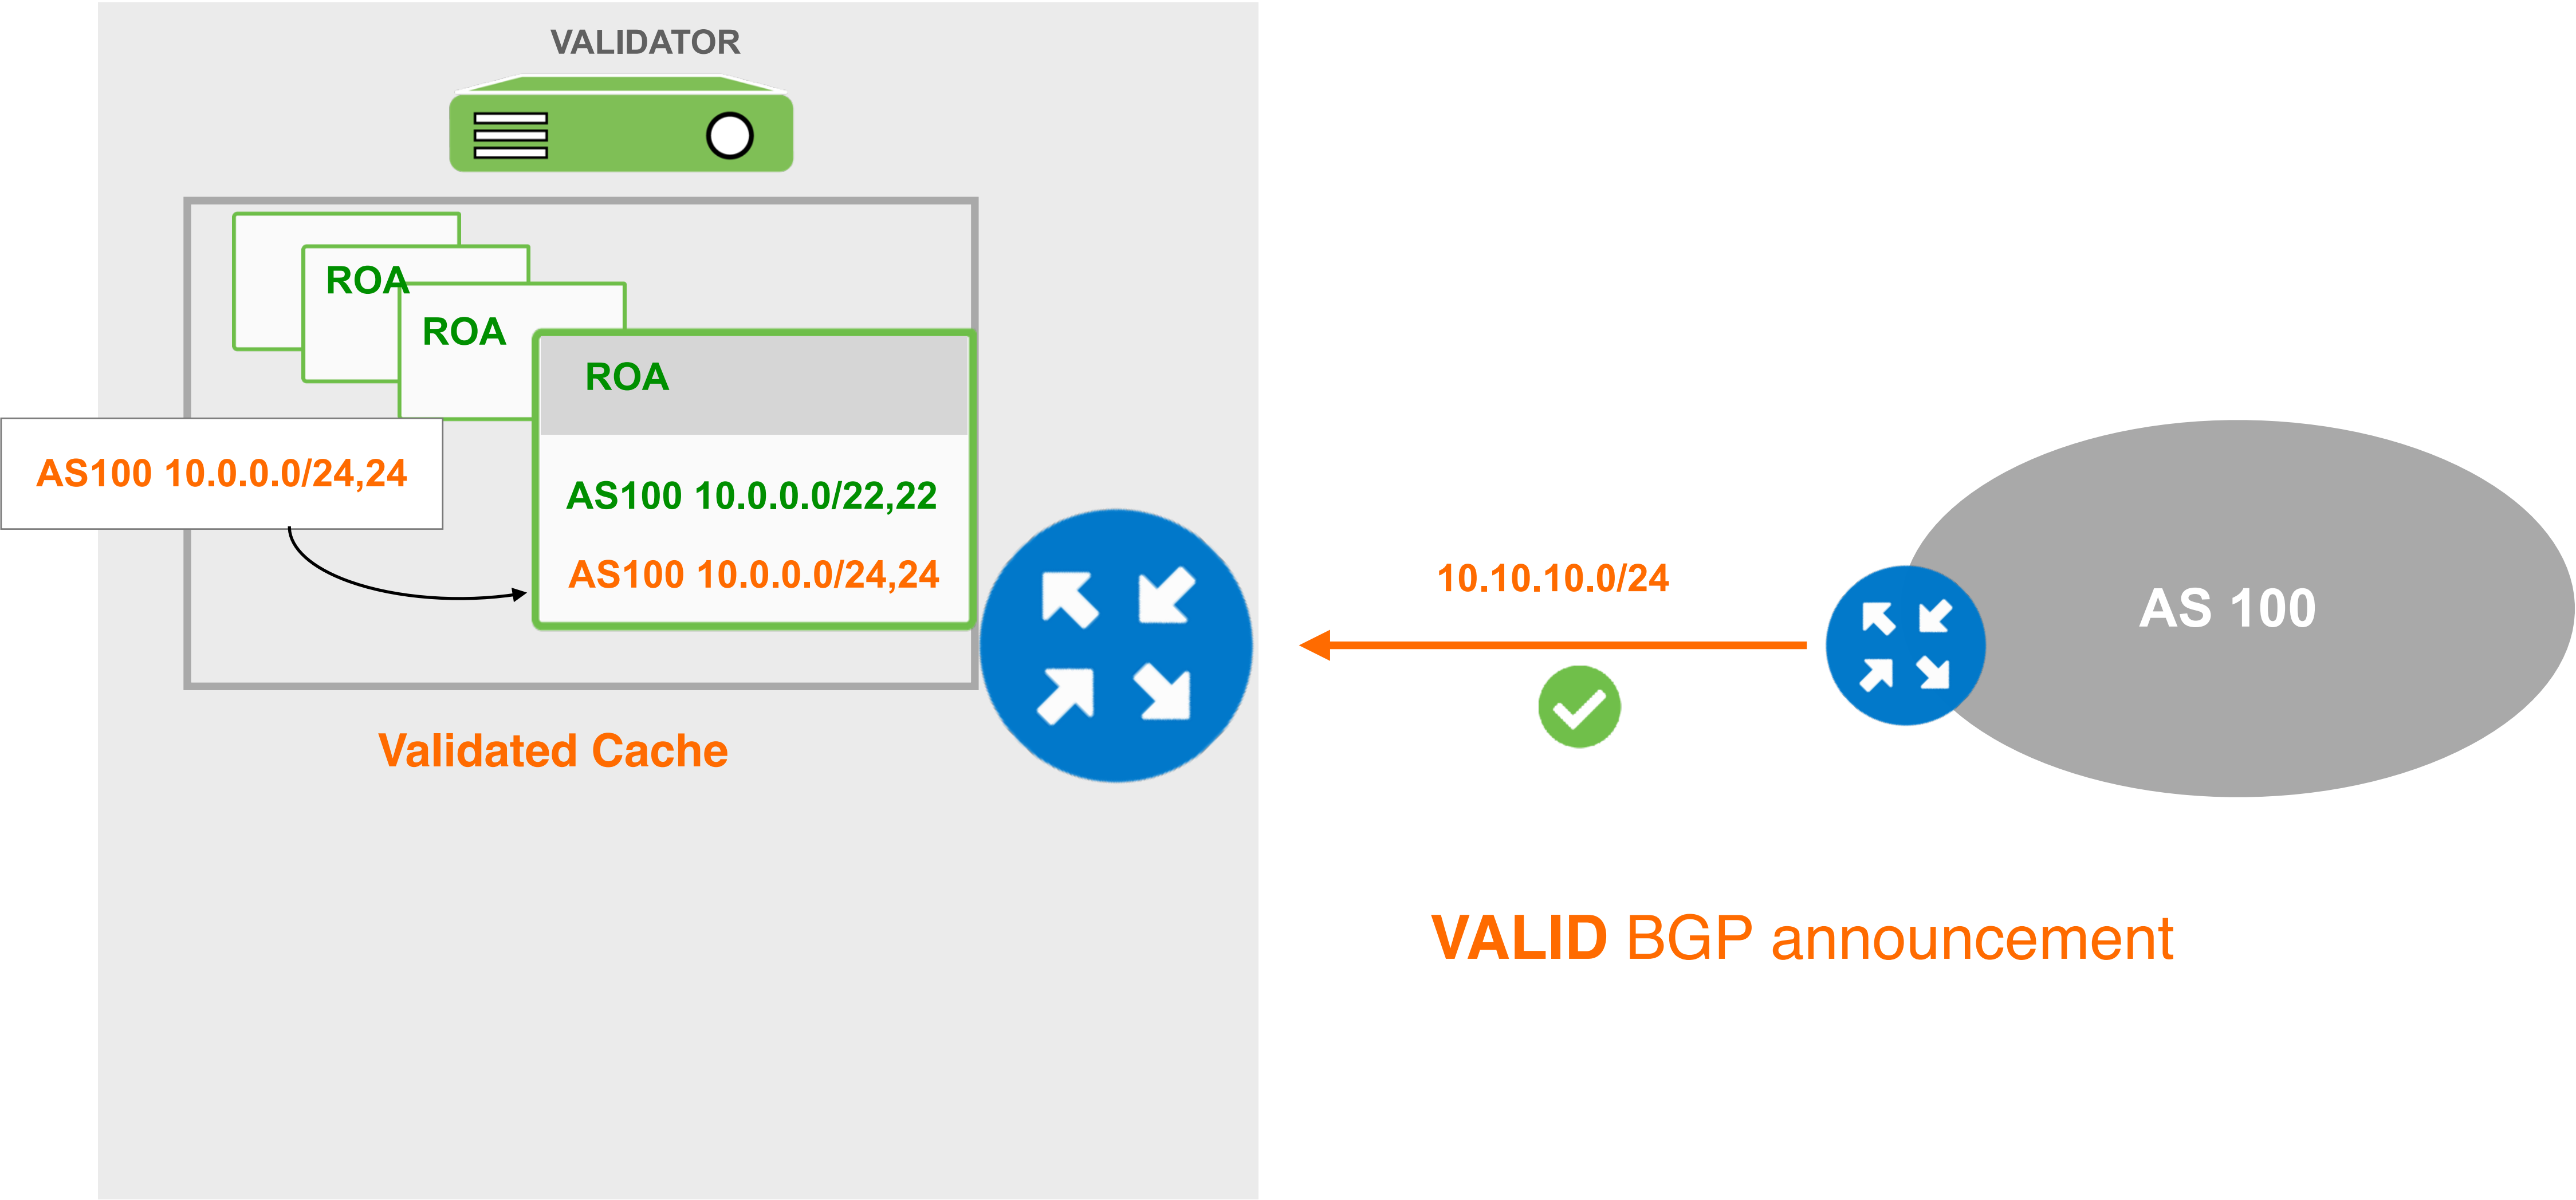

**INVALID BGP announcement**

# Whitelisting

# Whitelisting

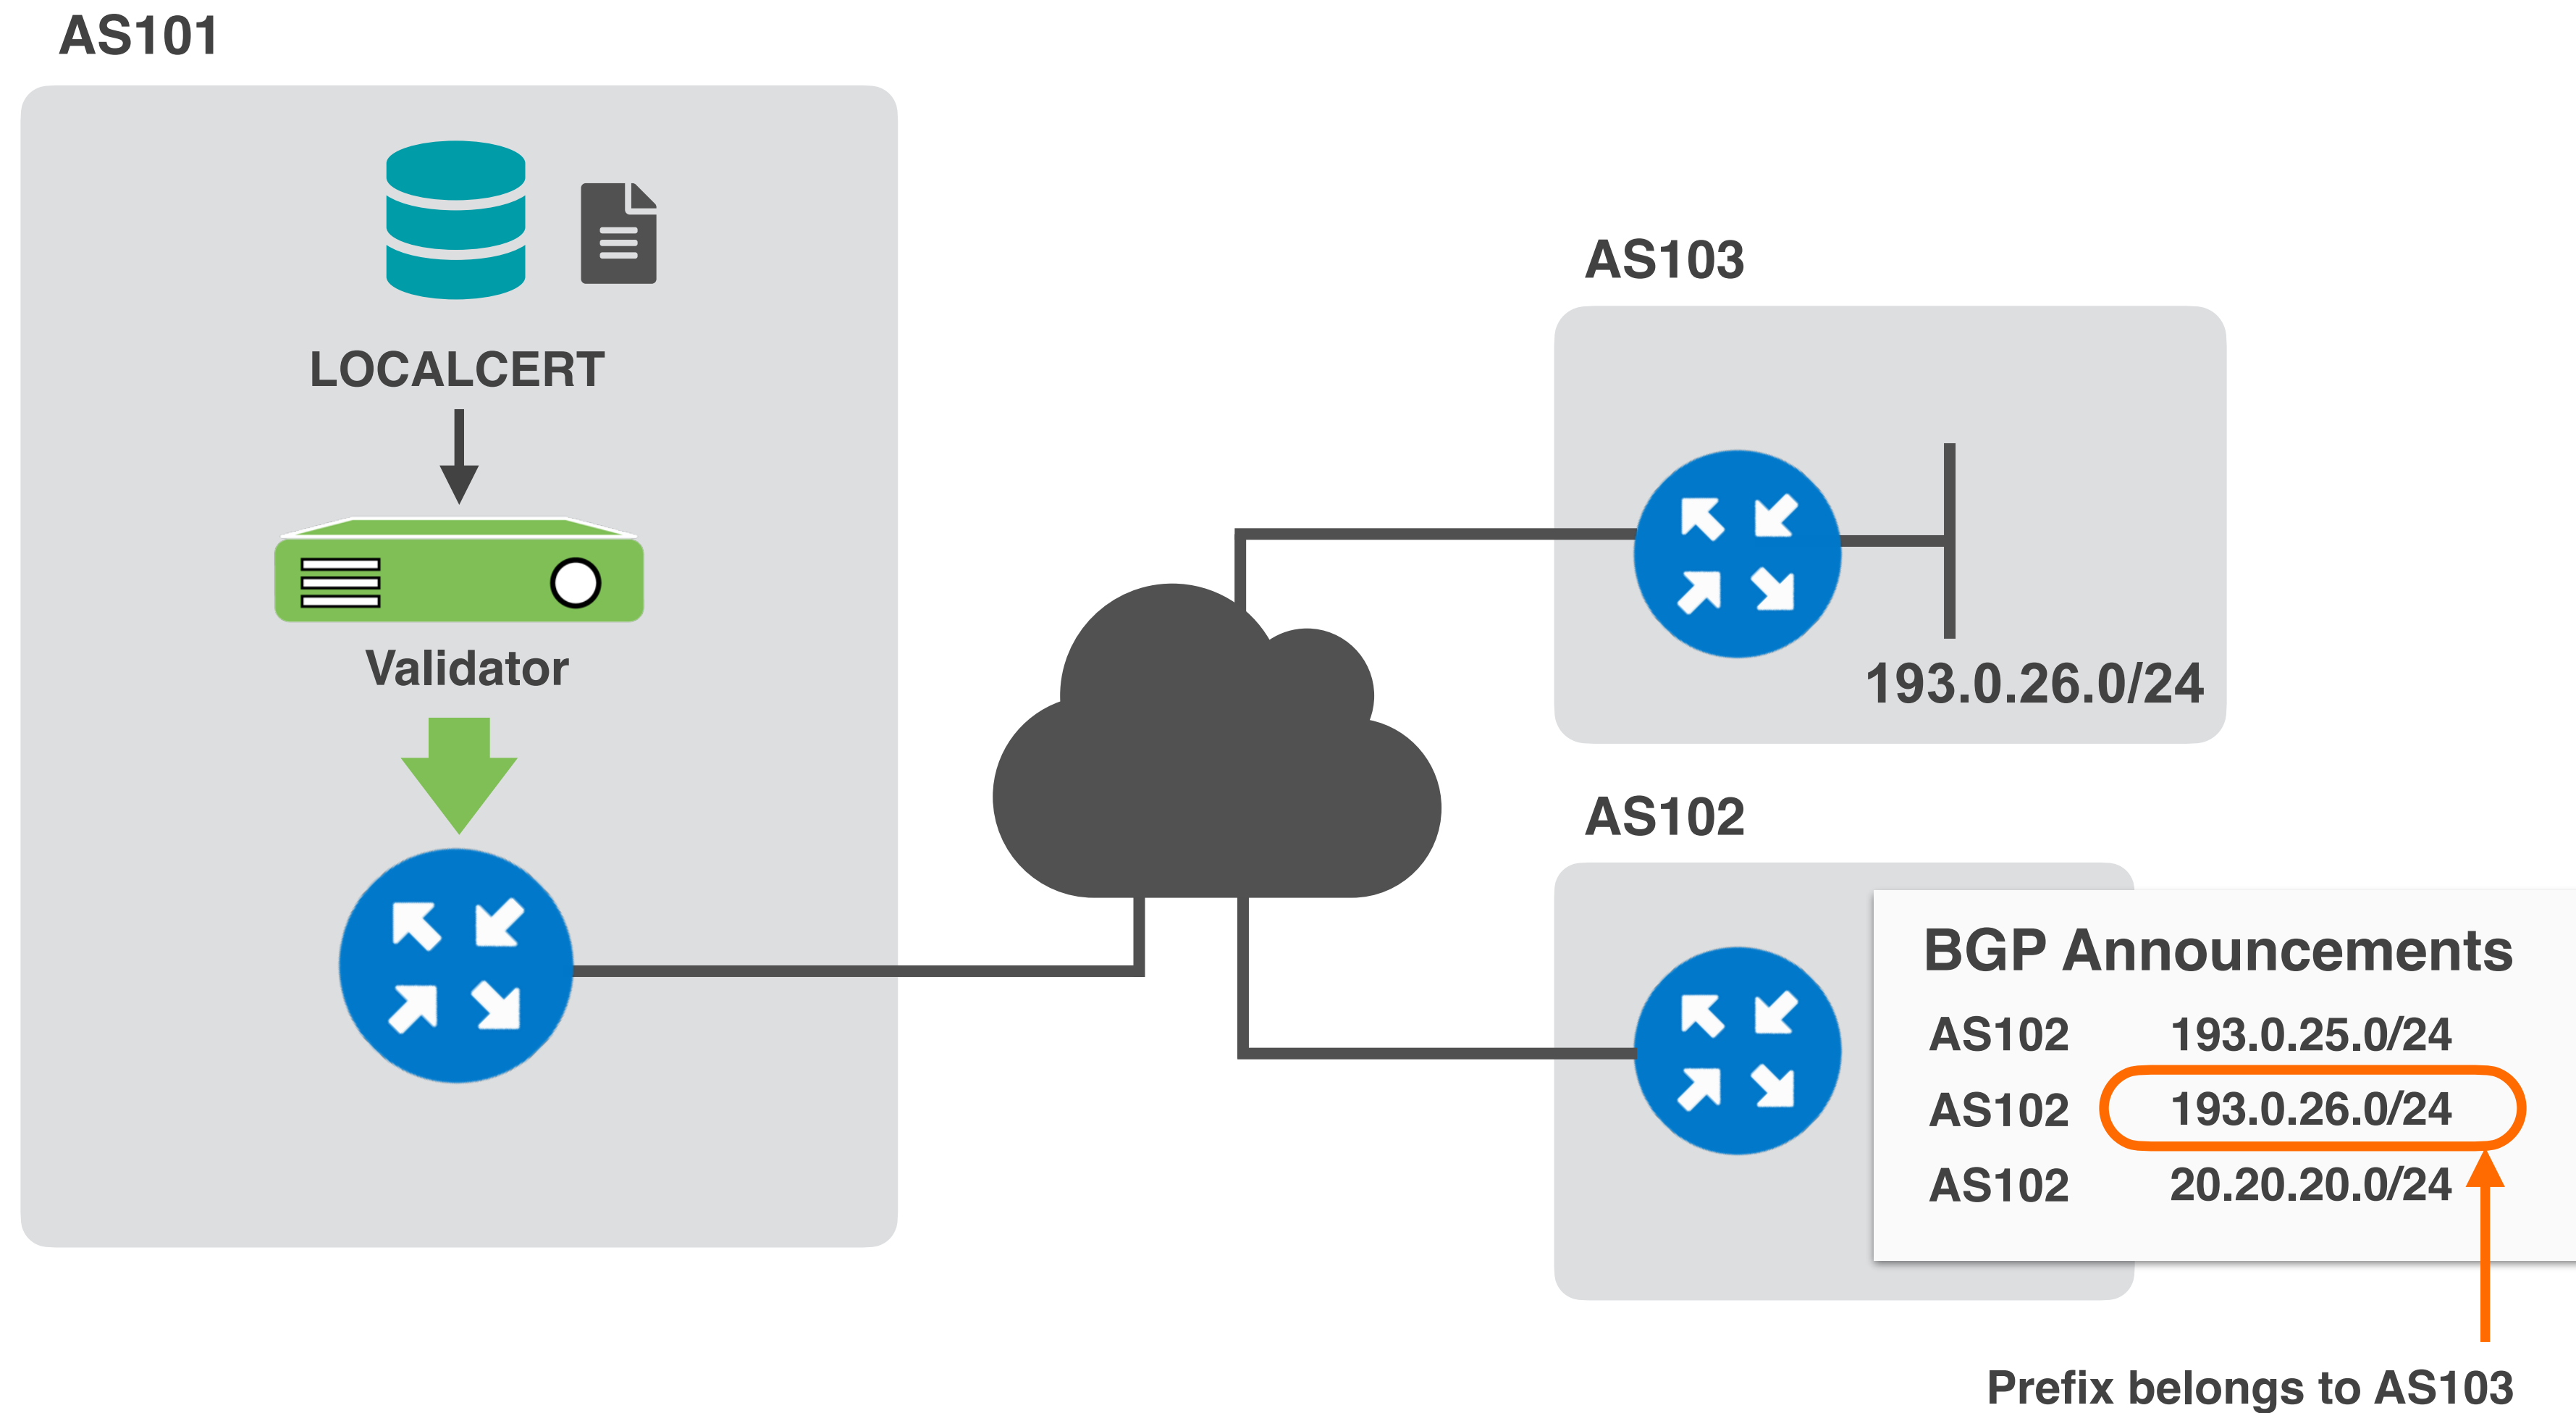

# Demo!

## Setting up BGP Origin Validation

# Demo Setup

# Set up Origin Validation in AS101

- We are using the **FORT** and **Routinator** validator options
- Both validators are preconfigured and already running!
- RPKI-RTR will be configured on **AS101 router**
- **AS102 router** will be configured to announce some prefixes;
  - its own prefix (**193.0.25.0/24**)
  - AS103 prefix (**193.0.26.0/24**) and will cause BGP prefix hijack
  - a prefix without a ROA (**20.20.20.0/24**)

# ROAs Created in the First Demo

**2 BGP Announcements** **4 ROAs**

2 Valid 0 Invalid 0 Unknown 4 OK 0 Causing problems

    192.168.1.2 from 192.168.1.254 (99.0.0.1)
      Origin IGP, metric 0, localpref 100, valid, external, best
      path 7FD8EAB30678 RPKI State valid
      rx pathid: 0, tx pathid: 0x0
```

# RPKI Invalid

Prefix belongs to AS103!

```
U1_Router#show ip bgp 193.0.26.0/24
BGP routing table entry for 193.0.26.0/24, version 0
Paths: (1 available, no best path)
  Not advertised to any peer
  Refresh Epoch 1
  99 102
    192.168.1.2 from 192.168.1.254 (99.0.0.1)
      Origin IGP, metric 0, localpref 100, valid, external
      path 7FD8EAB30708 RPKI State invalid
      rx pathid: 0, tx pathid: 0
```

# Prefix without a ROA

No ROA for this one!

```
U1_Router#show ip bgp 20.20.20.0/24
BGP routing table entry for 20.20.20.0/24, version 1598444
Paths: (1 available, best #1, table default)
  Not advertised to any peer
  Refresh Epoch 1
  99 102
    192.168.1.2 from 192.168.1.254 (99.0.0.1)
      Origin IGP, metric 0, localpref 100, valid, external, best
      path 7FD8EAB305E8 RPKI State not found
      rx pathid: 0, tx pathid: 0x0
```

# Questions

# **RPKI Validation**

**Discarding BGP Invalids**

# What to do with INVALIDs?

- For BGP origin validation to achieve its goal:
  - Invalids should be dropped!
- As a first step:
  - You can set lower local preference (not a long term solution)
  - Tag the invalids with a BGP community
- After analysing the effect, you can start dropping INVALIDs

# Demo!

Discarding **BGP Invalids**

# Configure Route Maps

Configure route-map on the router of **AS101** and apply to neighbour

```
(config-router)# route-map rpki-accept permit 10  
(route-map)# match rpki valid  
(route-map)# set local-preference 110  
(route-map)# route-map rpki-accept permit 20  
(route-map)# match rpki not-found  
(route-map)# set local-preference 80
```

```
(config)# router bgp 101  
(config)# address-family ipv4  
(config)# neighbor 192.168.1.254 route-map rpki-accept in
```

# Check Your Work

Clear your BGP session and check BGP table

```
# clear bgp ipv4 unicast 192.168.1.254  
# show ip bgp XXX
```

# RPKI Valid

```
U1_Router#show ip bgp 193.0.25.0/24
BGP routing table entry for 193.0.25.0/24, version 2205270
Paths: (1 available, best #1, table default)
  Not advertised to any peer
  Refresh Epoch 3
  99 102
    192.168.1.2 from 192.168.1.254 (99.0.0.1)
      Origin IGP, metric 0, localpref 110, valid, external, best
      path 7FD962379360 RPKI State valid
      rx pathid: 0, tx pathid: 0x0
```

# RPKI Invalid

Prefix belongs to AS103!

```
U1_Router#show ip bgp 193.0.26.0/24
% Network not in table
```

**Network is not in BGP table!**

# RPKI Invalid

Prefix belongs to AS103!

```
U1_Router#show ip bgp 193.0.26.0/24
% Network not in table
```

**Network is not in BGP table!**  
**Because RPKI status is **Invalid!****

# Prefix without a ROA

```
U1_Router#show ip bgp 20.20.20.0/24
BGP routing table entry for 20.20.20.0/24, version 2240082
Paths: (1 available, best #1, table default)
  Not advertised to any peer
  Refresh Epoch 3
  99 102
    192.168.1.2 from 192.168.1.254 (99.0.0.1)
      Origin IGP, metric 0, localpref 80, valid, external, best
      path 7FD95FF03740 RPKI State not found
      rx pathid: 0, tx pathid: 0x0
```
